

CONTENTS

II. QUANTUM ELECTRODYNAMICS	191
A. PHOTONS AND CHARGED FERMIONS	195
1. Field operators	195
2. Photons	196
3. Fermions	198
4. Destruction and creation of particles	204
5. Positrons	208
B. THE ELECTROMAGNETIC INTERACTION; FEYNMAN GRAPHS	212
1. The interactions between field and source	212
(a) The interaction operator	212
(b) Helicity rules in ultrarelativistic phenomena	214
(c) Vertices	216
2. The scattering amplitude	219
3. Compton scattering	221
(a) Diagrams for Compton scattering	221
(b) A spin-zero model	222
(c) Compton amplitudes and the Klein-Nishina formula	225
(d) Evaluation of cross sections	226
4. Feynman diagrams	228
5. The dimensionality of the coupling constant and the high-energy behavior of amplitudes	230
C. EXAMPLES OF ELECTROMAGNETIC INTERACTIONS	232
1. Scattering of two different fermions	232
2. Colliding beam processes: $e^+e^- \rightarrow \mu^+\mu^-$ and $e^+e^- \rightarrow e^+e^-$	235
3. Data on e^+e^- collisions; tests of quantum electrodynamics	238
4. Bound states	243
5. Hydrogen, μ -mesic atoms, and muonium	244
6. Positronium	247
7. The decay of positronium: Charge conjugation	248

D. THE SELF-ENERGY OF THE ELECTRON, VACUUM POLARIZATION, AND PRECISION TESTS OF QUANTUM ELECTRODYNAMICS 252

1. Radiative corrections 253
2. The electron self-energy and mass renormalization 255
3. Vacuum polarization 258
4. The Lamb shift 266
5. The anomalous magnetic moment of the electron and muon 270
6. Other spectroscopic tests of quantum electrodynamics 272
7. Summary 273

III. HADRONIC SPECTROSCOPY 275

A. HADRONIC DIMENSIONS AND SPECTRA 278

1. The electromagnetic size of hadrons 279
2. Hadronic diffraction scattering and the size of hadrons 281
3. Excited states of hadrons 283
4. Photoproduction 288
5. Pion-nucleon scattering 291
6. Consequences of the isospin assignments 295
7. Kaon-nucleon scattering and the $S \neq 0$ excited states of the baryon 297
8. Hadron excitations observed by decay 297
9. G -parity 303

B. MESONS COMPOSED OF HEAVY QUARK-ANTIQUARK PAIRS 312

1. $e\bar{e} \rightarrow \mu\bar{\mu}$ revisited 313
2. Narrow hadron resonances in $e\bar{e}$ -hadron production 317
3. The $Q\bar{Q}$ spectrum 323
4. Hadronic decays of $Q\bar{Q}$ states 333

IV. QUANTUM CHROMODYNAMICS 339

A. COLOR 342

1. The color variable 342
2. The group $SU(3)$ 347
 - (a) Definition of groups. $SU(2)$ and $SU(3)$ 348

- (b) An $SU(3)$ primer 350
- (c) Further aspects of $SU(3)$ 358

B. GAUGE FIELDS 364

- 1. Global vs. local symmetries 364
- 2. The gauge field 366
- 3. Quanta of the gauge field and coupling to quarks 371

C. GAUGE FIELD DYNAMICS 374

- 1. Color analogues of the electromagnetic field strengths 374
- 2. Self-interactions of the gauge field 377
- 3. The Yang-Mills field equations 377
- 4. Asymptotic freedom 380
 - (a) Comparison with QED 380
 - (b) Antiscreening—A qualitative discussion 381
 - (c) Antiscreening by an electromagnetic analogy 386
 - (d) The results of an exact perturbation calculation 390
 - (e) Renormalization of the coupling constant. Asymptotic freedom 394
- 5. Confinement 397
 - (a) The QCD vacuum 397
 - (b) The long-distance interaction 400
 - (c) The semiempirical quark-antiquark interaction 401

D. THE BAG MODEL 404

- 1. The primitive bag model 404
- 2. The improved bag model 409
- 3. Quantitative test of the model 414
- 4. The long-range potential and the Regge slope 417

V. DEEP INELASTIC LEPTON-HADRON SCATTERING 421

- 1. Introduction 423
- 2. Kinematic variables 425
- 3. Deep inelastic electron and muon scattering cross sections 427
- 4. Deep inelastic electron and muon scattering according to the quark model 428
- 5. The quark momentum distributions in the nucleon 432

6. Charge-changing neutrino scattering	439
(a) Cross sections for inelastic neutrino scattering	439
(b) Neutrino-quark cross sections	440
(c) Neutrino-nucleon scattering	442
(d) Structure functions	444
7. Theoretical considerations regarding the quark distributions	449
(a) The quark momentum distribution in the nucleon	449
(b) The gluon field in the nucleon	452
(c) The sea quarks	457
(d) The structure functions	459
8. Scaling violations	460

VI. THE ELECTROWEAK INTERACTION 465

A. CHARGE-CHANGING WEAK INTERACTIONS 469

1. The charge-changing weak current	469
2. The Hamiltonian for charge-changing weak interactions	474
(a) The Fermi interaction	474
(b) The strength of the semileptonic interaction	475
3. Defects of the $W^\pm$ model of weak interactions	478

B. NEUTRAL CURRENT WEAK INTERACTIONS AND THE ELECTROWEAK CONNECTION 483

1. Conservation of the weak current: The neutral current	483
(a) Demonstration that $J_\pm$ are not conserved currents	483
(b) Weak isospin	485
(c) Conservation of weak isospin	487
(d) The symmetric weak interaction	488
2. The electroweak connection	491
(a) Incorporation of electrodynamics	491
(b) The Z^0 and the mixing angle θ_w	493
(c) Unity and unification	495
3. Neutral current phenomena and the determination of the coupling constants	496
(a) The neutral current weak interaction	496
(b) Deep inelastic neutrino scattering	499
(c) Parity violation in inelastic electron scattering	502

(d) The basic parameters of the electroweak theory	504
(e) Z^0 -production in $e\bar{e}$ -annihilation	506
C. THE HIDDEN GAUGE INVARIANCE OF THE ELECTROWEAK INTERACTION	509
1. Hidden symmetry in ferromagnetism and superconductivity	509
(a) Ferromagnetism	509
(b) Superconductivity	511
2. The generation of mass in the electroweak theory	516
(a) Analogies between superconductivity and electroweak phenomena	516
(b) The electroweak gauge group	517
(c) The Standard Model; the masses of Z and W	519
(d) The Higgs boson and its couplings	523
D. GRAND UNIFICATION	529
1. Basic assumptions and immediate consequences	530
2. Evaluation of the electroweak angle at low energies	535
3. Other aspects of the Grand Unified Theory	540
(a) The gauge group	540
(b) Symmetry breaking	541
(c) Proton decay	542
Appendix II. Bose fields	545
1. The harmonic oscillator	545
(a) The classical oscillator	545
(b) Quantized oscillator	546
2. The scalar field	548
(a) Real fields	549
(b) Complex fields	553
3. The electromagnetic field	556
Appendix III. The Dirac field	559
1. The Lorentz transformation of spinors and the Dirac equation	559
(a) Three-vectors as 2×2 matrices	559
(b) Four-vectors as 2×2 matrices	560
(c) Spinors	562
(d) The Dirac equation	563

(e) Four-currents	566
2. The Dirac field operator	567
(a) The field operator: Anticommutation rules	567
(b) Energy, momentum, and charge	568
(c) The relative parity of particle and antiparticle	570
3. Amplitudes for weak and electromagnetic scattering	571
4. Spin and statistics	573
 Appendix IV. Causality and its consequences	577
1. The basic axiom of quantum field theory	577
2. The connection between spin and statistics	579
3. The need for antiparticles; Crossing symmetry	583
 Appendix V. Vacuum polarization	587
 Appendix VI. The magnetic susceptibility of a massless vector field	593
 Appendix VII. Solutions of Dirac's equation in a spherical enclosure	597
 Bibliography	600
 Index	603
