

CONTENTS

<i>Preface</i>	v
<i>Contents</i>	vii
<i>Contributors to Volume 1</i>	xii
1. Synchrotron radiation – a powerful tool in science	1
<i>E.-E. Koch, D.E. Eastman and Y. Farge</i>		
1. Synchrotron radiation as a scientific tool	3	
2. What is synchrotron radiation? A qualitative description of its properties	11	
3. Historical remarks	27	
4. Modern synchrotron radiation facilities	35	
5. Comparison of the properties of synchrotron radiation to other sources	41	
6. Research with synchrotron radiation	54	
7. Future prospects	58	
References	59	
2. Characteristics of synchrotron radiation and of its sources	65
<i>S. Krinsky, M.L. Perlman and R.E. Watson</i>		
1. Introduction	67	
2. Synchrotron radiation and classical electromagnetic theory	68	
3. Electron optics and storage rings	82	
4. Optical characteristics of the source	126	
5. Synchrotron radiation: theory versus experiment	138	
6. Wigglers, undulators and the free electron laser	140	
References	170	
3. Grating monochromators and optics for the VUV and soft X-ray region	173	
<i>R.L. Johnson</i>		
1. Introduction	175	
2. The optical elements	177	
3. The beamline	196	
4. Monochromator design	202	
5. Normal incidence monochromators	220	
6. Grazing incidence monochromators	227	
Appendix A: Basic formulae	254	
Appendix B: Aberration coefficients for TGM designs	255	
References	256	
4. X-ray monochromators	261
<i>T. Matsushita and H. Hashizume</i>		
1. Introduction	263	

2. Reflection of X-rays by optical surfaces	265
3. Diffraction of X-rays by single crystals	267
4. Graphic approach to X-ray optics	274
5. Flat-crystal optics	287
6. Focussing optics	291
7. Harmonics rejection	303
8. Special topics	307
References	312
 5. Photon detectors for the ultraviolet and X-ray region	315
<i>J.G. Timothy and R.P. Madden</i>	
1. Introduction	317
2. Detector systems	318
3. Photoemissive detectors	323
4. Photoconductive detectors	344
5. Radiometric calibration procedures	355
6. Summary of detector characteristics	361
References	364
 6. Transport, dispersion and detection of electrons, ions and neutrals	367
<i>E.H.A. Granneman and M.J. van der Wiel</i>	
1. Introduction	369
2. Liouville's theorem	370
3. Charged particle transport	373
4. Energy and mass analysis of charged particles	392
5. Particle detectors	433
6. Spin-polarized electrons	443
7. Coincidence techniques	448
References	456
 7. Interaction of radiation with condensed matter	463
<i>F. Bassani and M. Altarelli</i>	
Introduction	465
1. Macroscopic dielectric theory	465
2. Dispersion relations and sum rules	482
3. Lorentz-Drude oscillator model	497
4. Quantum theory of the optical constants	509
5. Interband transitions	532
6. Exciton effects	552
7. Two-photon transitions	577
8. Optical properties of various classes of materials	584
References	597
 8. Beyond the one-electron model: many-body effects in atoms, molecules, and solids	607
<i>C.-O. Almbladh and L. Hedin</i>	
1. Introduction	611
2. General concepts	615

3. X-ray spectra	645
4. A general framework for deep-level excitations and lifetime effects	726
5. Lifetime effects in absorption and emission spectra, incomplete relaxation	746
6. Spectra involving quasi-localized valence electrons (particularly d and f electrons)	856
7. Summary and outlook	893
References	898
 9. Photoelectron spectroscopy	
<i>N.V. Smith and F.J. Himpsel</i>	905
1. General considerations	907
2. Atoms and molecules	917
3. Bulk solids	926
4. Surfaces	936
5. Concluding remarks	950
Bibliography	951
References	951
 10. Basic principles and applications of EXAFS	
<i>E.A. Stern and S.M. Heald</i>	955
1. Introduction	957
2. Theoretical discussion	964
3. Experimental detection of EXAFS	986
4. Interpretation	995
5. Comparison with other techniques	998
6. Applications	999
7. Related phenomena and future directions	1009
References	1012
 11. X-ray diffraction, principles and applications	
<i>B. Buras, R. Fourme and M.H.J. Koch</i>	1015
Introduction	1017
1. Summary of the elementary theory of elastic X-ray scattering	1017
2. Diffraction studies with X-rays from conventional sources and from synchrotron radiation sources	1035
3. Applications of synchrotron radiation	1038
4. Scattering by randomly oriented systems	1058
5. Other systems	1072
6. Conclusion	1084
References	1085
 12. Soft X-ray optics and microscopy	
<i>E. Spiller</i>	1091
1. Introduction	1093
2. Material properties	1093
3. X-ray optics	1099
4. Microscopic methods	1114
References	1126

13. Synchrotron radiation X-ray lithography	1131
<i>W.D. Grobman</i>	
1. Overview	1133
2. The exposure process	1138
3. Thermal effects	1152
4. Comparison of storage ring and conventional source XRL systems	1155
5. Summary	1162
References	1164
