Translator's Note	v
Introduction	1
Physical properties of Fermi systems	1
Chapter 1 Green's functions in the study of Fermi systems	29
Green's functions and the graphical method	29
Analytical properties of Green's functions for Fermi systems	64
Single-particle Green's functions in an infinite system	82
Single-particle Green's functions for finite systems	94
Scattering amplitude	115
Chapter 2 Fermi systems in an external field	134
Systems without pairing correlation	134
Systems with pairing correlation	147
Effective fields and conservation laws. Quasi-particle charges	170
Probabilities and frequencies of single-particle and collective transitions	187
Change in the density matrix on addition of further particles	203
Chapter 3 Applications to nuclear physics	223
Justification and extension of the shell model	223
Interaction between nucleons in the nucleus	237

Symmetry energy and compressibility of nuclear matter	248
Nuclear magnetic moment	251
Isotopic shift of spectral lines and nuclear quadrupole moments	263
Nuclear moments of inertia	270
Electromagnetic transitions	274
β -decay in nuclei	292
Further development of the theory	300
Chapter 4 Abstracts of papers on nuclear theory	305
References	308
Index	313
