V. N. BAIER - Radiative polarization of electrons in storage rings.

1.	Introduction	pag.	1
2.	Radiative spin-flip transition.	»	2
2.1.	Method of approach	»	2
2.2.	Spin-flip transition	»	8
3.	Kinetics of radiative polarization	»	11
3.1.	Equation for the spin vector involving damping	»	11
3.2.	Solution of the kinetic equation	»	16
4.	Depolarization effects	»	20
4.1.	Elementary analysis of the dynamic depolarization	»	21
4.2.	Dynamic depolarization	»	24
4.3.	Stochastic depolarization	»	33
4.4.	Other depolarization effects	»	35
5.	Measurements of electron polarization.	»	35
5.1.	Measurements of polarization in the experiments with interaction of high-energy particles.	»	36
5.2.	Inner scattering effects (« Touschek effect ») and polarization measurement	»	38
5.3.	Measurements of polarization by Compton scattering	»	41
5.4.	Scattering on polarized electron target and measurement of polarization	»	42
5.5.	Some different methods	»	43
APPENDIX A - Calculation of $\langle t_0 \text{Re } T_2 t_0 \rangle$		»	44
APPENDIX B - Equation for the spin motion in the external field		»	45

E. CELEGHINI - Resonances from electron-positron colliding beams.	
1. Introduction	pag. 50
2. References frames	» 51
3. The vertex $r \rightarrow s+t$	» 53
4. The production process	» 55
5. General chain of resonances	» 56
6. Description of e^+ and e^- polarization	» 57
7. Meson and baryon vertices	» 58
8. General distributions in colliding beams	» 61
9. Speculations on the magnitude of the cross-sections	» 62
E. ETIM - Theory and applications of radiative corrections.	
1. Introduction	» 68
2. The infra-red divergence and the Bloch-Nordsieck theorem	» 68
3. Distribution function $dP(\omega)$ of energy loss	» 71
4. Normalization of $dP(\omega)$	» 73
5. $dP(\omega)$ for resonant processes	» 75
6. Conclusion	» 78
R. GATTO - Theory of e^+e^- annihilation at high energy. (Sum rules, asymptotic behaviours, algebra of compound fields).	
Introduction	» 80
1.	» 80
2.	» 82
3.	» 82
4.	» 84
5.	» 85
PART I. - Equal-time commutators	» 88
1. Equal-time commutators and Schwinger terms	» 88
1'1.	» 88
1'2.	» 88
1'3.	» 89
2. The spectral representation	» 90
2'1.	» 90
2'2.	» 91
2'3.	» 92
2'4.	» 92

3.	The ε -limiting procedure	pag.	92
3'1.	»	92
3'2.	»	93
3'3.	»	94
4.	Schwinger terms and seagulls	»	94
4'1.	»	94
4'2.	»	96
4'3.	»	97
4'4.	»	97
PART II – Sum rules		»	98
5.	Spectral representations for currents and Schwinger terms	»	98
5'1.	»	98
5'2.	»	99
5'3.	»	99
6.	Higher moment sum rules	»	102
6'1.	»	102
6'2.	»	103
6'3.	»	104
PART III – e^+e^- annihilation		»	105
7.	Application of the sum rules	»	105
7'1.	»	105
7'2.	»	106
7'3.	»	106
7'4.	»	107
7'5.	»	108
7'6.	»	109
8.	Asymptotic behaviour of the cross-section for annihilation into hadrons. Harmonic corrections to the photon propagator	»	110
8'1.	»	110
8'2.	»	110
9.	Pion form factor from elastic unitarity	»	112
PART IV – Field algebra		»	115
10.	Field-current identity	»	115
10'1.	»	115
10'2.	»	116
10'3.	»	116
10'4.	»	117
10'5.	»	118

11.	The ρ - γ coupling in an alternative form	pag. 118
11'1.	» 118
11'2.	» 119
11'3.	» 119
12.	Renormalization for the neutral ρ -meson	» 121
12'1.	» 121
12'2.	» 122
13.	Spectral sum rules from field-current identity	» 123
13'1.	» 123
13'2.	» 124
13'3.	» 125
13'4.	» 125
14.	Free gauge fields	» 126
15.	Algebra of fields	» 128
15'1.	» 128
15'2.	» 128
16.	Limiting cases of field algebra	» 131
16'1.	» 131
16'2.	» 132
16'3.	» 135
17.	The vanishing of the wave-function renormalization constant	» 137
17'1.	» 137
17'2.	» 139

J. HAISSINSKI – The Orsay electron-positron storage ring (status report).

1.	Magnetic structure of ACO. Choice of the « operating point »	» 141
2.	Beam energy	» 145
3.	Geometric structure of the bunches	» 148
4.	Interaction rates	» 149
5.	Prospects for \mathcal{L}	» 150
5'1.	Increase of σ_x	» 151
5'2.	Decrease of β^*	» 151
5'3.	Beam separation and/or crossing at an angle	» 151
6.	Injection routine and filling time	» 152
7.	Beam lifetime	» 153
8.	Spill-out of stored particles	» 154

J. HAISSINSKI - High-energy physics with the Orsay e^+e^- storage ring.	
1. Introduction	pag. 156
2. Normalization of cross-section measurements.	» 157
3. The experimental set-up	» 161
4. Quantum electrodynamics	» 162
4'1. Muon pairs	» 162
4'2. Bhabha scattering	» 162
5. Strongly interacting final states. Parametrization of the cross-sections	» 164
5'1. One-photon approximation and form factors	» 164
5'2. Parametrizations based on the vector-meson dominance model (VDM)	» 165
5'2.1. The vector dominance hypothesis	» 165
5'2.2. Partial decay widths	» 166
5'2.3. Parametrization of the form factors	» 167
5'2.4. Value of the cross-section at the peak of the resonance	» 168
5'3. Finite-width corrections to the pion form factor	» 169
5'4. Interference effects	» 171
6. Description of the experiments	» 171
6'1. Final-state identification	» 172
6'2. Background	» 173
6'3. Radiative corrections	» 174
7. Comparison of the experimental results with VDM predictions	» 174
7'1. Experimental results	» 174
7'2. Comparison with theoretical predictions	» 176
7'3. $\omega\phi$ interference	» 180
8. Conclusion	» 181
A. N. LEBEDEV - On the bunch lengthening effect in storage rings.	
1. Introduction	» 184
2. Beam dynamics	» 185
3. Straight vacuum chamber impedance	» 189
4. Instability increment and beam length	» 190
G. K. O'NEILL - The SU_6 quark model.	
1.	» 194
2.	» 198
2'1. The quark hypothesis	» 198
2'2. The SU_6 group	» 199

2'3. Puzzles	pag.	200
2'4. The construction of baryons by the quark model	»	200
3.	»	202
3'1. Symmetry	»	203
3'2. 10 and 8	»	204
4.	»	205
4'1. Direct consequences of the quark model	»	205
4'2. Mesons in SU_6	»	205
4'3. The generating operators of SU_6	»	207
5.	»	208
5'1. Three kinds of symmetry	»	209
5'2. From 216 to 56	»	209
6.	»	210
6'1. Symmetrizing the baryon octet-nucleon construction	»	210
7.	»	214
7'1. The nucleon magnetic moment ratio	»	215
8.	»	216
8'1. Hadron scattering; boson masses	»	216
 C. PELLEGRINI - Coherent instabilities in electron-positron storage rings.		
Introduction	»	221
1.	»	221
2.	»	224
3.	»	227
4.	»	232
5.	»	233
6.	»	240
 C. BACCI, G. PENSO, G. SALVINI, R. BALDINI-CELIO, C. MENCUCCINI, G. P. MURTAŞ, C. PELLEGRINI, A. REALE and M. SPINETTI - Reaction $e^+e^- \rightarrow \pi^0 + \gamma$ and $e^+e^- \rightarrow \eta + \gamma$: measurement of $\widehat{\omega\phi}$ and $\widehat{\gamma\eta'}$ mixing angles	»	244
1. The cross-section for the graphs of Fig. 1.	»	245
2. Some previsions of SU_3 for graph 2. The mixing angle	»	246
3. The previsions of the quark model. The mixing angle θ_ν	»	248
4. The Frascati experimental program for the $\pi^0\gamma, \eta\gamma$ final states	»	251
4'1. The experimental apparatus	»	252
4'2. The distinction between different reactions	»	253

4.3. Events with three γ 's detected	pag.	254
4.4. Events with 2γ 's detected.	»	254
4.5. Counting rates for $e^+e^- \rightarrow \pi^0\gamma (\gamma\gamma)$	»	254
5. Other theoretical previsions. The vector-dominance model. Other reasons of interest for processes (1) and (2)	»	255
M. SANDS - The physics of electron storage rings. An introduction.		
Most commonly used symbols.	»	257
PART 1. - An introductory overview		
1-1. Opening remarks	»	258
1-2. Basic processes	»	259
1-3. Collective effects	»	261
1-4. Two-beam effects	»	262
1-5. Luminosity	»	263
1-6. Beam density luminosity.	»	267
1-7. Maximum luminosity	»	268
1-8. Effective interaction area	»	271
PART 2. - The betatron oscillations		
2-1. Co-ordinates of the motion	»	273
2-2. The guide field.	»	274
2-3. Equations of motion	»	277
2-4. Separation of the radial motion	»	281
2-5. Betatron trajectories	»	282
2-6. Pseudoharmonic betatron oscillations	»	286
2-7. The betatron number v	»	291
2-8. An approximate description of betatron oscillations . . .	»	294
2-9. Nature of the betatron function	»	296
2-10. Disturbed closed orbits	»	302
2-11. Gradient errors.	»	306
2-12. Beam-beam interaction; tune shift.	»	309
2-13. Low-beta insert	»	315
PART 3. - Energy oscillations.		
3-1. Off-energy orbits	»	319
3-2. Orbit length: dilatation factor	»	322

3-3. Approximation for the off-energy function and the dilatation factor	pag. 325
3-4. Energy loss and gain	» 326
3-5. Small oscillations	» 335
3-6. Large oscillations: energy aperture	» 338
 PART 4. - Radiation damping	» 343
4-1. Energy loss.	» 343
4-2. Damping of the energy oscillations	» 346
4-3. Damping of betatron oscillations	» 349
4-4. Radiation damping rates.	» 355
 PART 5. - Radiation excitation	» 357
5-1. Quantum radiation	357
5-2. Energy fluctuations	» 363
5-3. Distribution of the fluctuations	» 368
5-4. Bunch length	» 372
5-5. Beam width	» 373
5-6. Beam height	» 379
5-7. Beam lifetime from radial oscillations	» 383
5-8. Beam lifetime from energy oscillations	» 389
 PART 6. - The luminosity of a high-energy storage ring	» 392
6-1. Recapitulation	» 392
6-2. The model storage ring	» 394
6-3. High-energy luminosity	» 396
6-4. Low-energy luminosity.	» 399
6-5. Maximum bunch length	» 403
6-6. Optimum luminosity function	» 405
6-7. Luminosity function for project SPEAR.	» 409
 K. G. STEFFEN - Selected topics of beam optics relevant to storage ring design.	
1. Introduction: Fundamentals of trajectory optics.	» 412
1'1. Curved co-ordinate system.	» 412
1'2. Linear trajectory equations and principle trajectory . .	» 412
2. Nondispersive deflecting systems	» 414
3. Isochronous deflecting systems	» 416

4. Amplitude and phase functions	pag.	418
5. Envelope in terms of generating trajectories	»	419
6. Collins' straight section	»	422
7. 4-dimensional envelope formalism in systems with x - z coupling	»	424
8. Closed orbit in a machine with bending-field distortions	»	429
9. Dispersion (closed orbit for particle with momentum deviation)	»	432
10. Orbit length and momentum compaction factor	»	434
11. Effect of focusing-field distortion on amplitude function and v -value	»	435
12. Resonant excitation of betatron oscillations	»	438
13. Magnet lattice and radiation damping	»	441
13.1. Combined function lattice with isomagnetic principal orbit, <i>i.e.</i> $1/\varrho = \text{const}$ in all magnets, and $k = 0$ for $1/\varrho = 0$	»	445
13.2. Separate function lattice with $(1/\varrho)k = 0$ everywhere and isomagnetic principal orbit	»	446
13.3. Lattice with $n = \varrho^2 k = \frac{1}{2}$ in all bending magnets (<i>e.g.</i> ADONE)	»	447
14. Fodo-channel for continuously varying the radiation damping distribution	»	447
15. Low- β insertion	»	450

RICHARD WILSON – Predictions for colliding-beam experiments at 3 GeV and some plans at CEA.

1. Elastic form factors and their extrapolation to the timelike region	»	453
1.1. Pion form factor	»	453
1.2. Elastic nucleon form factors	»	454
1.3. Isoscalar form factors	»	461
1.4. Relation to pp scattering and the Wu-Yang model	»	463
2. Inelastic scattering and its extrapolation	»	466
2.1. Nucleon inelastic scattering	»	469
2.2. Deep inelastic scattering	»	472
2.3. Explanation of the Bjorken limit	»	476
2.4. Summary of guesses for elastic processes	»	481
2.5. Summary of guesses for inelastic processes; resonance excitation	»	483
2.6. Total cross-section	»	483

3. Some experimental plans at CEA	pag. 483
3'1. The bypass on line detector.	» 483
3'2. Monitoring.	» 488
3'3. 4π magnetic detector	» 489
3'4. Less than 4π magnetic detector (BOLDER)	» 492
3'5. Miscellaneous experiments. SU_3 checks.	» 493
3'6. C and T checks	» 493
4. Progress report on the CEA bypass project	» 494
4'1. Low- β section	» 497
4'2. Some numbers of the CEA bypass.	» 502
APPENDIX I. - Kinematics and definitions	» 504
APPENDIX II. - Colliding-beam processes.	» 507
