## PART ONE

### ELEMENTARY PARTICLES

Prefatory Note	xiii
CHAPTER I. SINGLE PARTICLE WAVE FUNCTIONS AND WAVE EQUATIONS	3
1. Basic Postulates of Wave Mechanics	3
Concept of wave function and the Schrödinger equation	3
The principle of complementarity	4
The principle of superposition	9
2. Single Particle Wave Equations	
Spin and Pauli's equation	14
Relativistic requirements and the Klein-Gordon equation	18
The Dirac equation	21
Solutions of the Dirac equation for a free particle	24
Wave equations for proton and neutron	29
Wave equation for the meson	33
Wave equation for the neutrino	35
3. Wave Mechanics of the Photon	38
Wave equation for the photon	38
Schrödinger equation of the photon in momentum space	39
Energy of the electromagnetic field	40
Momentum of the photon field	41
Wave function in configuration space	41
Plane wave solutions	41
Angular momentum and spin of the photon	42
Spin wave functions	43
Angular momentum eigenfunctions	44
Parity eigenfunctions	45
Expansion of the electric and magnetic fields in terms of the photon eigenfunctions	47
Potentials and their expansions in terms of the eigenfunctions of angular momentum and parity	48
CHAPTER II. QUANTUM ELECTRODYNAMICS	
1. Perturbation Expansions and Kernel Functions	52
Old fashioned perturbation theory	55
Kernel function formalism	63

2. Perturbation Theory of the Dirac Electron	65
Feynman kernel and its momentum representation	65
Calculation of matrix elements	69
3. Applications to Electrodynamics	74
Compton effect	75
Two photon pair annihilation	79
Bremsstrahlung	81
Pair production	86
Electron-electron interaction	90
4. Self Energy and Renormalization	95
Self energy of the electron	97
Self energy of the photon	99
The vertex part	104
The anomalous magnetic moment of the electron	105
The Lamb shift	107
The removal of divergences from a general graph	109
CHAPTER III. FORMALISM OF QUANTUM FIELD THEORY	
1. The State Vector and Field Operators	112
Introductory remarks	112
Perturbation expansion in field theory	117
2. Normal Products and Wick's Theorem	126
Proof of Wick's theorem	130
3. Representation of Interactions in Field Theory	132
4. The Heisenberg Representation and Operators in Field Theory	133
The Heisenberg representation	133
Interaction of fermion and electromagnetic fields	137
Propagators in field theory	139
5. Transformation and General Principles of Invariance	143
General considerations	143
Particular transformations	147
Continuous transformations	160
CHAPTER IV. PION PHYSICS	
1. Introduction	167
Properties of the $\pi$ -meson	167
The resonances in the low energy pion-nucleon interaction	170
2. Earlier Attempts and Theories	172
Weak coupling theory	172
Strong coupling theory	175
Phenomenological theories	176

3. Other Theories not involving Expansion in terms of a Coupling Constant	180
Heitler's theory of radiation damping	180
The Tamm-Dancoff approximation	182
4. The Chew-Low Formalism	183
The Kemmer Hamiltonian	183
Pion-nucleon scattering	186
The theory of photo-meson production	194
CHAPTER V. NON-PERTURBATIVE APPROACH TO QUANTUM FIELD THEORY	
Single variable dispersion relations	203
The Mandelstam representation	213
CHAPTER VI. STRANGE PARTICLES AND THEIR INTERACTIONS	
1. Strange particles	221
Introduction	221
Isotopic spin and strangeness	223
2. Decays of $K$ Particles	230
The $\tau^+ - \theta^+$ puzzle	231
Neutral $K$ decay	237
The $ \Delta I  = 1/2$ rule	243
CHAPTER VII. WEAK INTERACTIONS	
1. Weak Interactions	246
Tests for invariances under $C, P, T$	247
Violation of $P$ and $C$ invariances in weak interactions	253
2. Universal Fermi Interaction	266
3. Some Recent Work on the Theory of Weak Interactions	277
CHAPTER VIII. STRONG INTERACTIONS AND STRANGE PARTICLES	
1. $K$ -particle Interactions	285
$K^+$ -interactions	285
$K^-$ -interactions	289
2. Hyperons and Hyperfragments	294
Production of hyperons	294
Hyperon interactions	296
Hyperfragments	297
3. Relative Parity between Strange Particles	305

## CHAPTER IX. SYMMETRIES AND STRONG INTERACTIONS

1. Introduction	325
2. Models of Strong Interactions	326
d'Espagnant-Prentki scheme	326
Global and cosmic symmetries	330
Doublet approximation	336
Pais model	340
Salam-Polkinghorne model	342
Feynman's model	348
3. Compound Models	351
4. Space-Time Properties and Internal Symmetries of Strong Interactions	353
Heisenberg's non-linear theory of elementary particles	356

## PART TWO

## COSMIC RAYS

## CHAPTER X. PRIMARY COSMIC RADIATION

1. Primary Cosmic Radiation	367
The mass spectrum	367
Energy spectrum and spatial distribution	370
2. Time Variation of Cosmic Rays	372
The diurnal variation	373
Variations at the source of cosmic radiation	373
Modulation effects	375
Prehistoric intensity variations	376

## CHAPTER XI. GEOMAGNETIC EFFECTS

1. Motion of a Charged Particle in the Field of a Magnetic Dipole	377
Equations of motion	377
2. Stormer and Main Cones	380
3. Deviations from the Stormer and Main Cones	383
4. Latitude Effect	392

## CHAPTER XII. INTERACTIONS OF COSMIC RAYS WITH MATTER

1. General Description	393
2. $\mu$ -meson Interactions in Cosmic Rays	396
Classical electromagnetic interactions: ionization	397
Collisions involving free electrons	397
Photoproduction	398

3. Theories of Multiple Production	400
Heisenberg's theory of multiple production	401
L.O.W. method	402
Fermi's statistical theory of multiple meson production	403
Some applications of Fermi's theory	411
Extension of Fermi's theory by Landau and Pomeranchuk	415
A covariant formulation of the statistical theory	420
Bhabha's theory	421
Isobar and fireball models	422
CHAPTER XIII. CASCADE PROCESSES	424
1. Introduction	424
Longitudinal development of showers	424
Lateral spread of showers	424
2. One-Dimensional Cascades	425
General formulation	425
Method of product density functions	427
Cascades involving only one type of particle	429
Electron-photon cascades	432
Alternative approach to the cascade theory	441
Further refinements to the cascade theory	443
Discussion of numerical results	447
Intranuclear cascades	454
3. Interactions at Extremely High Energies	457
Longitudinal developments of jets	457
The lateral spread of the extensive air showers (EAS)	461
4. Energy Balance of Cosmic Radiation	469
The $\mu$ -mesonic component	470
The electron-photon component	474
The nucleonic component	475
CHAPTER XIV. ORIGIN OF COSMIC RADIATION	
1. Theories of Intermediate Mechanism	480
Swann's mechanism	481
Fermi's mechanism of acceleration of particles	485
2. Sources of Cosmic Radiation	489
Solar contribution to cosmic radiation	490
Galactic sources of cosmic rays	492
APPENDICES	
1. Dimensions and Units	498
2. Composition of Angular Momenta	499
Addition of two angular momenta—Clebsch-Gordan coefficients	499
Computation of Clebsch-Gordan coefficients	501

Symmetry properties of the Clebsch–Gordan coefficients and the Wigner 3- $j$ symbol	502
Rotation matrices	503
The coupling of three angular momenta, Racah coefficients and the Wigner 6- $j$ symbol	503
The 9- $j$ symbol	505
3. Algebra of the $\gamma$ -Matrices	505
4. The Density of States	506
5. Relativistic Transformations	508
6. Invariant Functions	514
7. Quantization of the Electromagnetic Field	519
8. A Re-examination of the Equivalence of the Feynman and $S$ -matrix Formalisms	522
Mathematical preliminaries	523
A new viewpoint regarding the kernel function formalism of Feynman	524
Interaction term in quantum field theory	526
Derivation of the Feynman expansion from the $S$ -matrix formalism	527
9. On the Connection between Spin and Statistics	531
Hermitian spinzero field	531
Hermitian spin one-half field	532
Non-Hermitian fields	533
10. Phase Shift Analysis of Scattering	534
11. Numerical Results on Cascade Theory	537
Tables I–IX	537
12. Resonance States of Strongly Interacting Particles	546
The $\pi$ – $\pi$ resonance	546
The $3\pi$ resonances	546
The $K$ – $\pi$ resonance	546
The $\Lambda$ – $\pi$ resonance	547
The $\Sigma$ – $\pi$ resonance	547
The $\bar{K}$ – $\pi$ resonance	548
13. Gauge Theories of Elementary Particles	548
14. The Principle of Equivalence for all Strongly Interacting Particles	552
AUTHOR INDEX	553
SUBJECT INDEX	558
