CONTENTS

I.	**NON-RELATIVISTIC SPIN THEORY**	**1**
1.	Introduction	1
2.	Empirical Basis of the Spin Theory	2
3.	Formal Theory of Angular Momentum	3
	Definition of Angular Momentum. Eigenvalues and Eigenfunctions of the Angular Momentum Operators	
4.	Application to Spin One-Half	8
5.	Spatial Rotations	14
6.	Spin Projection Operators and Polarization	17
7.	Electron in a Central Field	19
	Spin-Orbit Coupling. Pauli Spinors in a Central Field. Anomalous Zeeman Effect	
8.	Coupling of Angular Momenta	25
	The Vector Addition Coefficients. Properties of the Spin-Angular Functions	
II.	**RELATIVISTIC QUANTUM MECHANICS OF FREE PARTICLES**	**32**
9.	Postulates of the Theory	32
10.	The Wave Equation	37
	The Second-Order Equation. The Dirac Wave Equation. The Covariant Form of the Wave Equation	
11.	The Dirac Matrices	44
12.	Spin and Constants of the Motion	49
13.	The Fundamental Theorem of Pauli	52
14.	Lorentz Transformation and Relativistic Covariance	55
	Covariance of the Equations of Motion. The Transformation Matrix. Bilinear Covariants	

III. DIRAC PLANE WAVES **68**

15. The Four Plane Wave States 68

The Wave Functions. The Spin Operator

16. Negative Energy Solutions. The Positron 74
17. The Properties of Free Positrons 78
18. The Diagonal Representation 83

Plane Waves. The Foldy-Wouthuysen Transformation

19. Projection Operators 92

General Properties. Energy Projection Operators. The New Representation. The Spin Projection Operators

20. Covariant Description of Spin 102
21. Application to Nuclear Beta Decay 105

IV. PARTICLE IN ELECTROMAGNETIC FIELDS **116**

22. The Wave Equation 116

Classical Electromagnetic Fields. The Equations of Motion. Magnetic Moment of the Electron. Foldy-Wouthuysen Transformation with External Fields

23. Spin Effects in Electric and Magnetic Fields 130

Polarization Effects and Covariant Spin Operator. Virial Theorem

24. Charge Conjugation 134
25. Space and Time Reflection 139

Space Reflection. Time Reflection. Transformation of the Adjoint Function. Transformation of the Bilinear Covariants under Time Reflection. Unitary Transformations

V. DIRAC PARTICLE IN A CENTRAL FIELD **157**

26. Wave Equation in Polar Coordinates 157
27. Free Particle Solutions 161
28. General Properties of the Radial Functions 163

Normalization of Bound State Wave Functions. Nodes of the Radial Functions

29. Coulomb Field. Bound States 169
30. Anomalous Zeeman Effect 181

31. Hyperfine Structure 188
32. Coulomb Field. Continuum States 191
33. Scattering Theory 196

The Density Matrix. Formal Theory of Scattering of Polarized Electrons. The Scattering Amplitudes

34. Time-Dependent Perturbations 211

VI. APPROXIMATION METHODS 219

35. The Classical Limit 219
36. The Born Approximation 223

Retarded Interaction between Charged Particles. The Breit Interaction. Scattering of Fast Electrons by Nuclei

37. Compton Scattering of Circularly Polarized Radiation 232
38. Sommerfeld-Maue Approximation 237
39. Finite Nuclear Size Effects 240

Wave Functions inside the Nucleus. Scattering Phase Shifts

40. The Dirac Equation at High Energies 246

VII. NEUTRINO THEORY 253

41. Four-Component Formulation 253

Mass of the Neutrino. Neutrino Helicity. Charge Conjugate States

42. The Two-Component Theory 258

The Weyl Equation. Relation to the Majorana Theory. Covariance of the Theory. Two-Component Neutrino in Beta Decay. Angular Momentum Representation

Appendix A. Notation 273
Appendix B. Lorentz Transformations 276
Appendix C. Time-Dependent Operators 279
Appendix D. An Alternative Approach to the Dirac Matrices 281
Appendix E. Retarded Electromagnetic Interaction 286
