Preface to First Edition	<i>page v</i>
Preface to Fourth Edition	vii
<b>I INTRODUCTION</b>	<b>1</b>
Flame – Stationary flames – Propagating flames – Physics or chemistry?	
<b>II PREMIXED FLAMES</b>	<b>7</b>
The Bunsen burner – The Méker burner – Laminar premixed flames – The Smithells separator – Turbulent flames – Flame stability – Quenching – Low-pressure flames and their structure – Spontaneous ignition and cool flames – Ignition by external means – Limits of flame propagation – The position of luminous zones – Polyhedral and cellular flames – The transition between premixed flames and diffusion flames.	
<b>III FLOW VISUALISATION AND FLAME PHOTOGRAPHY</b>	<b>40</b>
The gas flow from a burner – The measurement of the gas flow – Laser-Doppler anemometry – The photography of the flame cone – Particle-track photography – Schlieren photography – Interferometry – Lasers and holography – The flame thrust, and its effect on cone shape – The tip of the flame.	
<b>IV MEASUREMENTS OF BURNING VELOCITY</b>	<b>58</b>
The burning velocity – Gouy's flame-area method – Modified flame-area and cone-angle methods – The nozzle method – The particle-track method – Methods of locating the flame front – Rectified flat-flame methods – The flame-thrust method – The soap-bubble method – The spherical-bomb method –	

The revised tube method – Comparison of burning velocity measurements – The temperature dependence of burning velocity – The pressure dependence of burning velocity – The influence of hydrocarbon structure on burning velocity – The influence of mixture strength, diluents and additives – The burning velocity of turbulent flames.

## V THE STRUCTURE OF THE REACTION ZONE AND ITS RELATION TO FLAME PROPAGATION

92

Introduction – The preheating zone – The ignition point – The reaction zone; radical concentrations – The reaction zone; its thickness in relation to burning velocity – The relation between burning velocity, temperature and radical concentration – The effect of additives on burning velocity, flammability limits and spontaneous thermal ignition – Early thermal and diffusion theories of flame propagation – Combined thermal and diffusion theories – The concept of excess enthalpy – The concept of flame stretch – Reaction rates – The formation of oxides of nitrogen – Flame propagation in turbulent gases.

## VI DIFFUSION FLAMES

146

The height and shape of small flames – The candle flame – The Wolfhard–Parker flat diffusion flame – Spectroscopic study of structure – Counter-flow diffusion flames – Comparison of diffusion with premixed flames – Turbulent flames – Thin flames – The Coanda burner – Furnace flames – Combustion of droplets and dusts – Flames on wicks; mixed fuels – Combustion of liquids at a free surface.

## VII FLAME NOISE AND FLAME OSCILLATIONS

177

Flame noise – Jet noise – Singing flames – Combustion chamber oscillations – Flame flicker and other instabilities – Sensitive flames – The influence of sound on premixed flames.

## VIII SOLID CARBON IN FLAMES

195

Introduction – Diffusion flames – Premixed flames – The effect of pressure – The effect of temperature – Explosion flames – The effect of non-metallic additives – The effect of metallic additives – Electrical effects – The nature of carbon particles and deposits – The equilibrium between carbon and the burnt gases – Detection of intermediate products – Isotope

	<i>Page</i>
tracer studies – The pyrolysis of hydrocarbons – The problem of the formation and growth of soot particles – The carbon-black process.	
<b>IX RADIATION PROCESSES IN FLAMES</b>	<b>238</b>
The nature of radiation – The equipartition of energy – Processes of electronic excitation – Conditions for radiative equilibrium – Chemiluminescence – Departures from equilibrium in flame gases – Radiation and scattering from solid particles – Calculations of radiative heat transfer.	
<b>X FLAME TEMPERATURE. I. MEASUREMENT BY THE SPECTRUM-LINE REVERSAL METHOD</b>	<b>268</b>
Flame temperature? – The sodium-line reversal method – Corrections for reflection loss and for change of brightness temperature with wavelength – Effect of complex flame structure – Use of other lines for reversal work – Background sources – Adaptations for non-visual recording and for time-resolved studies – Accuracy and reliability – The Kurlbaum method – Results for interconal gases – Results for reaction zones.	
<b>XI FLAME TEMPERATURE. II. OTHER METHODS OF MEASUREMENT</b>	<b>291</b>
Brightness and emissivity methods – The colour-temperature method – The line-ratio method – Effective translational temperature by Doppler broadening – Rotational temperatures – Vibrational temperatures – Laser-Raman scattering – Refractive-index methods – $\alpha$ -particle and X-ray methods – Sonic methods – Hot-wire methods – Ionisation and electron temperatures.	
<b>XII FLAME TEMPERATURE. III. CALCULATED VALUES</b>	<b>323</b>
Systematic calculation of composition for a given temperature – Calculation of temperature – Values for equilibrium constants, enthalpies, etc. – Discussion of the effect of varying mixture strength – The effect of pressure – Temperatures and compositions of some typical flames.	

	<i>Page</i>
<b>XIII IONISATION IN FLAMES</b>	<b>340</b>
Measurement of ionisation – Ionisation in local thermodynamic equilibrium (LTE) – The role of chemical reactions in the ionisation of metal additives – Ionisation in hydrocarbon flames – Further investigations of ion reactions in flames – The effect of electric fields on flames – Ionisation in rocket exhausts.	
<b>XIV COMBUSTION PROCESSES OF HIGH-ENERGY AND ROCKET-TYPE FUELS</b>	<b>372</b>
Flames supported by oxides of nitrogen – Nitric acid flames – Nitrate and nitrite flames – Propellant flames – Halogens as oxidisers – Ozone – Metal alkyl flames – High-energy fuels – Combustion of solid fuels – Ignition and flammability of solids – The burning characteristics of solids – Supersonic combustion.	
<b>XV FLAME PROBLEMS</b>	<b>401</b>
<b>REFERENCES</b>	<b>406</b>
<b>AUTHOR INDEX</b>	<b>427</b>
<b>SUBJECT INDEX, with definitions of symbols and values of physical constants, units and conversion factors.</b>	<b>439</b>
