

CONTENTS

<i>Chapter</i>	<i>Page</i>
I. INTRODUCTION	1
Flame—Stationary flames—Propagating flames—Physics or chemistry?	
II. PREMIXED FLAMES	7
The Bunsen burner—The Meker burner—Laminar premixed flames—The Smithells separator—Turbulent flames—Flame stability—Quenching—Low-pressure flames and their structure—Ignition—Limits of flame propagation—The position of luminous zones—Polyhedral and cellular flames—The transition between premixed flames and diffusion flames	
III. FLOW PATTERNS AND FLAME SHAPES	41
The gas flow from a burner—The measurement of the gas flow—The photography of the flame cone—Schlieren photography—Interferometry—The flame thrust, and its effect on cone shape—The tip of the flame	
IV. MEASUREMENTS OF BURNING VELOCITY	56
The burning velocity—Gouy's method—The nozzle method—The Leeds method—Rectified flat flame methods—The particle-track method—Measurements with parabolic flows from cone angle at $r/R=0.4$ —Methods of locating the flame front—The flame-thrust method—The soap-bubble method—Spherical-bomb method—The revised-tube method—Comparison of burning velocity measurements—The temperature dependence of burning velocity—The pressure dependence of burning velocity—The influence of hydrocarbon structure on burning velocity—The influence of diluents and additives	
V. THE MECHANISM OF FLAME PROPAGATION	89
Introduction—The preheating zone—The ignition point—The reaction zone—The relation between burning velocity, temperature and radical concentration—Further evidence concerning burning velocity and also limits of flame propagation—Some observations of the flame front—Thermal theories of flame propagation—Diffusion theories—Flame propagation in turbulent gases	
VI. DIFFUSION FLAMES	134
Early work on small flames—Turbulent flames—The candle flame—The flat diffusion flame—Spectroscopic study of structure—Comparison of diffusion with premixed flames—Furnace flames—Droplet combustion—Flames on wicks; mixed fuels—Thin flames	

Chapter

Page

VII. UNSTABLE FLAMES

161

Sensitive flames—The influence of sound on premixed flames—
Singing flames—Flame vibration and flame noise

VIII. SOLID CARBON IN FLAMES

175

Introduction—Diffusion flames—Premixed flames—The effect
of pressure—Explosion flames—The effect of additives—The
nature of carbon particles and deposits—The equilibrium be-
tween carbon and the burnt gases—Detection of intermediate
products—The pyrolysis of hydrocarbons—The problem of the
formation and growth of carbon particles—The carbon black
process

IX. RADIATION PROCESSES IN FLAMES

210

The nature of radiation—The equipartition of energy—Processes
of excitation by collision—Conditions for radiative equilibrium
—Chemiluminescence—Departure from equilibrium in flame
gases—Radiation from solid particles

X. FLAME TEMPERATURE: I. MEASUREMENT BY
THE SPECTRUM-LINE REVERSAL METHOD

234

Flame temperature?—The sodium-line reversal method—Cor-
rections for reflection loss and for change of brightness tempera-
ture with wavelength—Effect of complex flame structure—Use
of other lines for reversal work—Background sources—Adaption
for time-resolved studies—Accuracy and reliability—The Kurl-
baum method—Results for interconal gases—Results for
reaction zones

XI. FLAME TEMPERATURE: II. OTHER METHODS
OF MEASUREMENT

256

Brightness and emissivity methods—The colour-temperature
method—Ornstein's two-line method—Effective translational
temperature by Doppler broadening—Rotational temperatures
—Vibrational temperatures—Refractive index methods—
 α -particle and X-ray methods—Sonic methods—Hot-wire
methods—Ionisation methods

XII. FLAME TEMPERATURE: III. CALCULATED
VALUES

283

Systematic calculation of composition for a given temperature
—Calculation of temperature—Available values for equilibrium
constants, etc.—Discussion of the effect of varying mixture
strength—Temperature and compositions of some typical flames

<i>Chapter</i>	<i>Page</i>
XIII. IONISATION IN FLAMES	302
Equilibrium ionisation; the Saha equation—The time factor; recombination of ions—Measurements with probes, etc.—The Hall effect—Micro-wave attenuation—The effect of electric fields on flames—The amount of ionisation in flame gases—Identification of positive ions—The cause of the high ionisation in organic flames	
XIV. COMBUSTION PROCESSES OF ROCKET-TYPE FUELS	324
Flames supported by oxides of nitrogen—Nitric acid flames—Nitrate and nitrite flames—Propellant flames—Halogens, as oxidisers—Ozone—High energy fuels—Combustion of solid fuels	
XV. RECENT PROGRESS ON SOME FLAME PROBLEMS	351
REFERENCES	357
AUTHOR INDEX	371
SUBJECT INDEX	377
