

CONTENTS

<i>Preface</i>	ix
I. THE SIMPLE SHOCK TUBE	1
Introduction	1
Historical	3
Applications in chemistry	4
Applications in physics	6
Astrophysical applications	7
II. THE SHOCK WAVE IN AN IDEAL GAS	9
Sound waves and shock waves	9
The growth of a shock wave	10
Rarefaction waves	12
PRIMARY SHOCK WAVES	13
Basic equations	13
Derivation of shock parameters in an ideal gas	15
Dependence of shock strength on diaphragm pressure ratio	18
Comparison between shock-wave and isentropic heating	21
REFLECTED SHOCK WAVES	23
Reflected shock parameters in an ideal gas	24
Comparison of the states behind incident and reflected shocks	27
III. THE SHOCK WAVE IN A REAL GAS	29
Specific heat of a real gas	30
Variation of shock parameters in a real gas	31
Valid shock relations for a real gas	34
The enthalpy of a non-dissociating real gas	35
Calculation of the equilibrium state of a non-dissociating real gas	37
The enthalpy of a real dissociating gas	39
Calculation of the equilibrium state of a real dissociating gas	41
The equilibrium state of an ionised gas	46
Enthalpy contribution from electronic excitation	49
Enthalpy values at high temperatures	51
Summary	51

IV. GAS FLOWS AND ASSOCIATED EFFECTS IN SHOCK TUBES	57
FLOW DURATION IN AN INVISCID GAS	57
General considerations	57
Interaction of a rarefaction wave with the contact surface	58
Flow duration in the incident shock	60
Minimum length of tube for working in the incident shock	63
Interaction of the reflected shock and contact surface	63
Observation time in the reflected shock	66
Reduction of flow duration due to real-gas effects	67
Laboratory and gas particle times	69
VISCOUS FLOW AND BOUNDARY-LAYER LIMITATIONS	70
Effect on flow duration and speed of the incident shock	72
Closure of the boundary layer	74
Effect on observation time and conditions in the reflected shock	74
Flow duration at low initial pressure	76
The nature and width of the contact surface	77
INFLUENCE OF DIAPHRAGM-OPENING PROCESS ON SHOCK SPEED	79
Influence of diaphragm-opening time	79
Influence of initial three-dimensional flow	81
V. SHOCK-TUBE DESIGN AND TECHNIQUES	83
The basic tube	83
Shock-tube diaphragms and bursting techniques	88
Improvement of shock-tube performance by heating driver gas	92
Improvement of shock performance by area reduction in tube	96
Improvement in performance by combined modification	97
The tailored-interface shock tube	98
Overall length of shock tube and optimum position of observation station	99
Converging shock waves	103
Electromagnetically driven shocks	105
Shock-tube hazards	106

VI. THE MEASUREMENT OF SHOCK SPEED	108
Pressure-transducer detectors	109
Optical detectors (light-screen schlieren and reflection)	110
Temperature-sensitive resistance detectors	113
Positive-ion beam detector	116
Glow-discharge detector	117
Ionisation detectors	118
Detector noise levels, impedances and response times	119
Measurement of time intervals	121
Continuous measurement of shock speed	127
VII. THE MEASUREMENT OF PRESSURE AND DENSITY	133
Pressure measurement	134
Diaphragm pressure transducers	134
Limitations of diaphragm transducers	136
Piezo-electric transducers	138
Pressure calibration and display	142
Density measurement	142
Schlieren recording	143
Shadow recording	145
Light sources and time-resolved schlieren and shadowgraph recording	147
Interferometric measurement	150
The Mach-Zehnder interferometer	152
X-ray and particle-absorption densitometry	159
VIII. MEASUREMENT OF TEMPERATURE	162
Introduction	162
The spectrum-line reversal method	163
The sensitivity and accuracy of the reversal method	168
The choice of line for spectrum reversal	174
Background sources for reversal	176
The brightness and emissivity method	180
The two-line method	182
Rotational temperatures	183
Vibrational temperatures	185
The breadth and shape of spectrum lines	186
IX. RELAXATION PROCESSES AND TIMES	189
Introduction	189
Rotational relaxation	193
Vibrational relaxation	194
Dissociation rates	202
Ionisation	207
Radiation relaxation	211
Relaxation processes in expanded flows	211

X. EMISSION AND ABSORPTION SPECTRA	213
The nature of spectra	213
Photography of shock-wave spectra	215
Time resolution of spectra	216
Spectra of inert gases	219
Spectra of O₂, N₂ and air	221
Molecular spectra	226
Atomic spectra	229
Excitation processes	229
Absorption spectra	234
Determination of oscillator strengths	237
XI. CHEMICAL STUDIES IN THE SHOCK TUBE	241
Experimental techniques	241
Carbon formation	245
Oxides of nitrogen	247
Simple chemical reactions	249
Determination of dissociation energies	251
Ablation	254
XII. SHOCK-IGNITED DETONATIONS	257
The nature of detonation	257
Shock and detonation waves	261
The speed of a detonation wave	262
The Chapman-Jouguet plane	267
Calculation of the state of the gas in a detonation	269
The shock initiation of detonations	273
The structure of an established detonation wave	275
Spectra of detonations	279
Initiation of detonation with weak shocks	282
