1 Concepts in analytical chemistry		
1.1 Introduction	1	
1.2 Terms and definitions in analytical chemistry	1	
1.3 Units of measurement: the international system (SI) of units	4	
1.4 Statistics	7	
1.5 Detection limits	15	
1.6 Sampling strategies: inhomogeneity effects	18	
1.7 Contamination effects	20	
1.8 Reporting analytical data	27	
1.9 Standard additions calibrations	28	
1.10 Rock reference materials	28	
1.11 Which technique for which element?	42	
2 Classical and rapid methods of analysis		
2.1 Rock dissolution techniques: acid attack	47	
2.2 Rock dissolution procedures: fusion with alkali salts	52	
2.3 Classical methods of rock analysis	55	
2.4 Evolution of rapid methods of analysis	58	
2.5 Photometry	58	
2.6 Flame photometry	62	
2.7 Titrations involving ethylenediaminetetraacetic acid (EDTA)	64	
2.8 A rapid scheme of analysis	66	
2.9 Determination of ferrous iron	67	
2.10 The determination of water and carbon dioxide	70	
2.11 The auto-analyser	75	
3 Optical spectrometry: principles and instrumentation		
3.1 Principles	71	
3.2 The nature of light	78	
3.3 Atomic spectroscopy	80	
3.4 The electronic structure of atoms: quantum theory	80	
3.5 Spectroscopic notation for electron orbital configurations: the Russell-Saunders coupling scheme	82	
3.6 The absorption of light	86	
3.7 The emission of light	88	
3.8 Instrumentation for optical spectroscopy	90	
3.9 Monochromator	91	
3.10 Optical filters	97	
3.11 Slits	98	
3.12 Photon detectors	99	
3.13 Classical monochromator designs	100	
3.14 Stray light effects	103	
3.15 Errors in spectrometric measurements	103	
4 Atomic absorption spectrometry		
4.1 Introduction	106	
4.2 Instrumentation	107	
4.3 Properties of flames	114	
4.4 Flame chemistry and atomization interferences in the flame: atomization processes in the flame	117	
4.5 Instrumental and spectral interferences	120	
4.6 Instrument optimization for routine analysis	121	
4.7 Schemes of analysis using flame atomic absorption	122	
4.8 Interference suppression	123	
4.9 Detection limits	127	
4.10 Routine performance	128	
4.11 Electrothermal atomization	128	
4.12 Atomization in the hollow graphite furnace	130	
4.13 Background correction	138	
4.14 Geological applications of furnace AAS	144	
4.15 Cold vapour and hydride generators	146	
4.16 Solid sampling and novel atomization devices	150	
5 Inductively coupled plasma-atomic emission spectrometry		
5.1 Historic development and analytical capabilities	153	
5.2 The inductively coupled argon plasma	153	
5.3 Nebulizers and spray chambers	156	
5.4 Physical structure of the plasma	163	
5.5 Temperature distribution in the plasma	165	
5.6 Atomization and excitation processes	165	
5.7 Interferences in the argon plasma	167	
5.8 Measurement and analysis of emission spectra	169	
5.9 Some instrument considerations—simultaneous <i>v.</i> sequential monochromators	173	
5.10 Optimizing operating parameters	175	
5.11 Calibrations for ICP-AES	179	
5.12 Silicate rock analysis	183	
5.13 Direct current plasma-optical emission spectrometry	192	
6 Arc and spark source optical emission spectrometry		
6.1 Historical perspective	198	
6.2 Instrumentation	198	
6.3 Sample preparation	200	
6.4 Behaviour of elements in an arc discharge	201	
6.5 Simultaneous multi-element analysis	205	
6.6 Conclusions	212	
7 Ion-selective electrodes		
7.1 Analytical perspective	213	
7.2 Instrumentation	213	
7.3 The Nernst equation	216	
7.4 Interference effects: non-ideal Nernst behaviour	217	
7.5 Schemes for the analysis of geological samples for fluorine	218	
7.6 Determination of chlorine by ion-selective electrodes	219	
7.7 Other techniques for the determination of chlorine and fluorine	222	
8 X-ray fluorescence analysis: principles and practice of wavelength dispersive spectrometry		
8.1 Analytical characteristics	226	
8.2 Energy and wavelength of x-rays	226	
8.3 The origin of x-ray spectra	227	
8.4 Competing de-excitation routes	233	
8.5 Excitation of x-ray spectra	236	
8.6 Interaction of x-rays with matter	239	

8.7	Matrix effects in geological samples	242	11.6	Transmission electron microscopy : the chemical analysis of thin foils	396
8.8	Mathematical procedures for the correction of absorption-enhancement effects	249	12 Neutron activation analysis		
8.9	Instrumentation for wavelength dispersive XRF analysis	253	12.1	Introduction	399
8.10	Experimental considerations	271	12.2	The growth and decay of radioactivity	399
8.11	Routine operating conditions and statistical considerations	278	12.3	Radioactive decay schemes	402
8.12	Performance in routine analysis	282	12.4	Instrumentation	405
8.13	Concluding remarks	285	12.5	Pulse-processing electronics	409
9 Energy dispersive X-ray spectrometry			12.6	Interaction of gamma radiation with germanium detectors	411
9.1	The development of energy dispersive XRF	286	12.7	Typical spectrum	413
9.2	The Si(Li) detector	286	12.8	Detector characteristics	414
9.3	Detector configuration and characteristics	289	12.9	Practical considerations—instrumental neutron activation	416
9.4	Pulse processing electronics	293	12.10	Determination of photopeak areas	419
9.5	Interaction of x-rays with the silicon detector	297	12.11	Other analytical considerations	422
9.6	Comparison of ED and WD spectrometers	299	12.12	Interferences and systematic errors	424
9.7	Silicate rock analysis by ED-XRF using direct tube excitation	300	12.13	Routine schemes of analysis	429
9.8	Spectrum analysis procedures	307	12.14	Chondrite normalized abundances	430
9.9	Routine analysis using direct tube excitation	308	12.15	Epithermal <i>v.</i> thermal irradiations	432
9.10	Indirect excitation methods	315	12.16	Short-lived isotopes	435
9.11	Monochromatic polarized excitation using Bragg diffraction at $2\theta = 90^\circ\text{C}$	321	12.17	Radiochemical separation procedures	435
9.12	Radioisotope excitation	322	12.18	Prompt gamma neutron activation analysis	438
9.13	Total reflection of primary beam	323	12.19	Concluding remarks	439
9.14	Concluding remarks	325	13 Nuclear techniques for the determination of uranium and thorium and their decay products		
10 Electron probe microanalysis			13.1	Techniques for uranium/thorium determination	440
10.1	The development of microprobe techniques	326	13.2	The uranium–thorium decay chain	441
10.2	Microbeam techniques	326	13.3	Delayed neutron fission activation analysis	441
10.3	Instrumentation for the electron probe microanalyser	327	13.4	Fission track analysis	445
10.4	Electron column design	331	13.5	Other autoradiography techniques for locating and analysing specific elements in thin section	448
10.5	Vacuum requirements	335	13.6	Gamma spectrometry	452
10.6	Interactions between the electron beam and sample : the excited volume	336	13.7	Alpha spectrometry	459
10.7	Phenomena within the excited volume	337	13.8	Secular equilibrium with particular reference to uranium/thorium disequilibrium measurements	461
10.8	X-ray production	343	13.9	Uranium and thorium series disequilibrium	462
10.9	Matrix correction procedures	348	14 Ion exchange preconcentration procedures		
10.10	X-ray spectrometers	353	14.1	Introduction	472
10.11	Calibration and routine operation	358	14.2	Ion exchange techniques	472
10.12	Energy dispersive spectrometers	360	14.3	Characteristics of ion exchange resins	474
10.13	Sample preparation requirements	364	14.4	Some theoretical aspects of ion exchange	477
10.14	Microprobe mineral standards	364	14.5	Optimizing column separations	480
10.15	Routine analytical performance	366	14.6	Applications of ion exchange chromatography to rare-earth element separations	480
10.16	Analysis of non-silicate minerals : uranium, thorium and rare-earth elements	371	14.7	Chelating ion exchange resins	484
10.17	Bulk rock analysis by electron microprobe	378	14.8	Other preconcentration procedures	485
10.18	The SEM as a microprobe	380	15 Gold and platinum group element analysis		
10.19	Concluding remarks	381	15.1	Introduction	486
11 Other microbeam and surface analysis techniques			15.2	Fire assay procedures	487
11.1	Introduction	383	15.3	Acid extraction of noble metals	492
11.2	The ion probe	383	15.4	Other methods of noble metal analysis	492
11.3	The laser microprobe	391	15.5	Noble metal analysis—comparisons of data	493
11.4	Particle-induced x-ray emission (PIXE)	392	15.6	A note on the distribution of noble metals	494
11.5	Electron spectroscopy for chemical analysis (ESCA)	395	15.7	Graphical presentation of PGE data	496

16 Mass spectrometry : principles and instrumentation

16.1	Introduction	497
16.2	Mass spectrometric techniques in geology	497
16.3	The ion source	498
16.4	The mass analyser	498
16.5	Resolution	500
16.6	Double-focusing mass spectrometer	502
16.7	Quadrupole mass spectrometer	503
16.8	Ion detectors	505
16.9	Vacuum requirements	508
16.10	Abundance sensitivity	508
16.11	Beam switching <i>v.</i> multiple collection	509
16.12	Isotopes and mass spectra : the structure of atoms and nuclear stability	510
16.13	Mass defect phenomena	512
16.14	Radioactive isotopes in nature	512
16.15	Geochronology	514
16.16	Geochronometers of geological importance	516

17 Thermal ionization mass spectrometry

17.1	Introduction	523
17.2	Ion production	523
17.3	Rubidium–strontium isotope analysis	525
17.4	Neodymium–samarium isotope analysis	528
17.5	Lead, uranium and thorium isotope analysis	531
17.6	Isotope dilution	536

18 Gas source mass spectrometry

18.1	Geological applications	546
18.2	Instrumentation	546
18.3	The delta convention for reporting isotope data	552

18.4	Hydrogen isotope analysis	552
18.5	Carbon isotope analysis	554
18.6	Nitrogen isotope analysis	555
18.7	Oxygen isotope analysis	556
18.8	Sulphur isotope analysis	558
18.9	Noble gas analysis	559
18.10	Potassium–argon geochronometry	560

19 Spark source mass spectrometry

19.1	Introduction	566
19.2	Instrumentation and ion production	566
19.3	Internal standardization	568
19.4	Routine data acquisition	568
19.5	Photoplate calibration and element sensitivities	569
19.6	Applications and results	571
19.7	Future developments	573

20 Inductively coupled plasma–mass spectrometry

20.1	Introduction	575
20.2	Development of ICP–MS instrumentation : the plasma–mass spectrometer interface	575
20.3	The inductively coupled plasma as ion source	578
20.4	ICP–mass spectrometry instrumentation	582
20.5	Performance and applications	583
20.6	Internal standardization	583
20.7	Isotope dilution	584
