## Part I. The theory of the radiative equilibrium of stellar photospheres and the continuous spectrum of stars

|  |    |
|--|----|
| <i>Chapter 1. Introductory remarks . . . . .</i>   | 1  |
| <i>Chapter 2. Basic concepts of the theory of radiation. The equations of transfer</i>   |    |
| 1. The part played by radiation in stellar photospheres . . . . .  | 3  |
| 2. The intensity and flux of radiation . . . . .   | 3  |
| 3. The coefficients of emission and absorption . . . . .   | 6  |
| 4. The equation of transfer of radiation . . . . .   | 8  |
| <i>Chapter 3. Radiative equilibrium of the stellar photosphere. The solution of the equation of transfer</i>                             |    |
| 1. The condition of radiative equilibrium . . . . .  | 10 |
| 2. The hypothesis of local thermodynamic equilibrium . . . . .   | 13 |
| 3. The solution of the equations of transfer . . . . .   | 14 |
| 4. The averaging of the equations of transfer over angles . . . . .  | 17 |
| <i>Chapter 4. The theory of radiative equilibrium for an absorption coefficient independent of the frequency</i>                         |    |
| 1. The variation of the temperature with depth in the photosphere . . . . .  | 21 |
| 2. The law of darkening of the star's disc towards the limb . . . . .  | 25 |
| 3. The continuous spectrum of the star . . . . .   | 27 |
| <i>Chapter 5. The coefficients of continuous absorption</i>  |    |
| 1. The chemical composition of stellar atmospheres . . . . .   | 31 |
| 2. The excitation and ionisation of atoms . . . . .  | 34 |
| 3. The true absorption of radiation . . . . .  | 39 |
| 4. Photoelectric absorption for hydrogen-like atoms . . . . .  | 42 |
| 5. The allowance for stimulated emission . . . . .   | 45 |
| 6. Free-free transitions. Final results . . . . .  | 50 |
| 7. Non-hydrogen-like atoms. Negative hydrogen ions. The scattering of radiation by free electrons . . . . .                              | 52 |
| <i>Chapter 6. The distribution of energy in the continuous spectra of stars for an absorption coefficient depending on the frequency</i> |    |
| 1. The absorption of radiation in the photospheres of stars of various spectral classes . . . . .  | 56 |
| 2. Radiative equilibrium in the photospheres of stars of classes A 0 to B 2 . . . . .  | 60 |
| 3. Comparison of theory and observation . . . . .  | 66 |
| 4. Stars of spectral classes close to that of the Sun . . . . .  | 70 |
| 5. Stars of other spectral classes. Stars with extended photospheres . . . . .   | 73 |
| <i>Chapter 7. The structure of stellar photospheres</i>  |    |
| 1. The structure of the photospheres of stars of the classes A 0 to B 2 . . . . .  | 76 |
| 2. Discussion of the theoretical results . . . . .   | 82 |
| 3. The application of the law of darkening towards the limb of the star's disc . . . . .   | 85 |

*Chapter 8. The application of the laws of thermodynamic equilibrium to stellar photospheres*

|  |     |
|--|-----|
| 1. Preliminary remarks on the deviations from thermodynamic equilibrium in stellar photospheres . . . . .    | 86  |
| 2. The velocity distribution of atoms and electrons in stellar photospheres . . . . .                        | 89  |
| 3. The photo-ionisation of atoms . . . . .   | 91  |
| 4. The ionisation of atoms by collision. Comparison with photo-ionisation. Recombination processes . . . . . | 96  |
| 5. The ionisation equation. The electron temperature. . . . .  | 100 |
| 6. The application of Kirchhoff's Law . . . . .  | 105 |

**Part II. The formation of absorption lines in the spectra of stars**

*Chapter 9. The mechanism of the formation of absorption lines in stellar atmospheres*

|  |     |
|--|-----|
| 1. Basic definitions . . . . .   | 107 |
| 2. The mechanism of the formation of absorption lines. . . . .   | 108 |
| 3. The derivation of the equation of transfer for coherent scattering . . . . .  | 111 |
| 4. The solution of the equations of transfer . . . . .   | 112 |
| 5. The derivation of the equation of transfer, taking account of processes of scattering and of true absorption. . . . . | 116 |

*Chapter 10. The solution of the equations of transfer for frequencies inside absorption lines*

|   |     |
|---|-----|
| 1. Introductory remarks . . . . .   | 118 |
| 2. A model of the atmosphere with a constant ratio of the absorption coefficient in the line to the continuous absorption coefficient . . . . . | 118 |
| 3. The numerical integration of the equations of transfer . . . . .   | 121 |
| 4. The solution of the equation of transfer for faint lines . . . . .   | 122 |

*Chapter 11. The coefficients of selective absorption*

|  |     |
|--|-----|
| 1. The relation between the absorption coefficients and the transition coefficients. . . . . | 127 |
| 2. Radiation damping . . . . .   | 128 |
| 3. Thermal and turbulent motions of atoms. . . . .   | 134 |
| 4. The simultaneous action of radiation damping and the motion of atoms . . . . .            | 136 |
| 5. Pressure effects . . . . .  | 139 |
| 6. Line broadening by collisions . . . . .   | 141 |
| 7. The statistical broadening of lines . . . . .   | 143 |
| 8. Concluding remarks . . . . .  | 145 |

*Chapter 12. The application of the elementary theory of contours. Curves of growth*

|  |     |
|--|-----|
| 1. The elementary theory of contours . . . . .   | 147 |
| 2. Comparison of theoretical and observed contours . . . . .   | 151 |
| 3. The elementary theory of curves of growth . . . . .   | 152 |
| 4. Methods of constructing curves of growth from observations . . . . .                                      | 158 |
| 5. Laboratory, theoretical, and "solar" line intensities . . . . .   | 161 |
| 6. Curves of growth constructed from observation. Turbulent velocities in the atmospheres of stars . . . . . | 163 |
| 7. The excitation temperature. The damping constant . . . . .  | 166 |
| 8. Critical remarks . . . . .  | 168 |

|   |     |
|---|-----|
| <i>Chapter 13. The interpretation of observed contours of absorption lines in stellar and solar spectra</i>   |     |
| 1. The calculation of the ratio of the coefficients of selective and continuous absorption . . . . .  | 170 |
| 2. The application of the theory to solar absorption lines. The part played by pressure effects . . . . .   | 174 |
| 3. Lines of metals in the spectra of stars. Line broadening by turbulence . . . . .   | 179 |
| 4. The Balmer series in the spectra of stars. . . . .   | 182 |
| 5. The determination, from lines of the Balmer series, of the acceleration due to gravity in the atmospheres of stars . . . . .                                   | 187 |
| 6. Helium lines. The distortion of contours by neighbouring lines . . . . .   | 189 |
| 7. The rotation of stars . . . . .  | 193 |
| <i>Chapter 14. The variation of absorption-line contours from the centre to the limb of the solar disc. Non-coherent scattering. Central residual intensities</i> |     |
| 1. The variation of absorption-line contours from the centre to the limb. Interlocking . . . . .  | 198 |
| 2. Non-coherence of scattering processes . . . . .  | 204 |
| 3. Central residual intensities in absorption lines. Comparison of theory and observation . . . . .   | 208 |
| 4. Deviations from thermodynamic equilibrium in the Sun. Stars of other spectral classes . . . . .  | 213 |
| <i>Chapter 15. Methods of studying the chemical composition of stars. The results of investigations</i>   |     |
| 1. The application of the elementary theory of curves of growth to the study of the chemical composition of stars. The mean electron concentration . . . . .      | 218 |
| 2. The distribution of atoms among excitation states . . . . .  | 223 |
| 3. Refined methods of studying the chemical composition of the stars. Faint lines . . . . .   | 225 |
| 4. The results of investigations . . . . .  | 230 |
| <i>Chapter 16. The interpretation of the spectral sequence. The absolute-magnitude effect. The scale of effective temperatures</i>                                |     |
| 1. Introductory remarks . . . . .   | 235 |
| 2. The variation of line intensities with increasing temperature . . . . .  | 237 |
| 3. The effect of the acceleration due to gravity . . . . .  | 241 |
| 4. The differences between the spectra of dwarfs and giants. The absolute-magnitude effect . . . . .  | 245 |
| 5. The scale of effective temperatures. . . . .   | 248 |
| <b>Part III. The physics of the solar envelopes</b>   |     |
| <i>Chapter 17. The structure of the solar photosphere. Granulation. Convection</i>  |     |
| 1. The structure of the solar photosphere . . . . .   | 256 |
| 2. Convective processes in the solar photosphere. Granulation . . . . .   | 260 |
| <i>Chapter 18. The electrodynamics of the Sun's atmosphere</i>  |     |
| 1. Introductory remarks . . . . .   | 265 |
| 2. The conductivity of the solar atmosphere in a magnetic field . . . . .   | 268 |
| 3. The interaction of electrons and ions. . . . .   | 272 |
| 4. Electric fields on the Sun. . . . .  | 277 |
| 5. Thermal and mechanical effects of currents . . . . .   | 280 |
| 6. Allowance for self-induction . . . . .   | 283 |
| 7. The propagation of a magnetic field . . . . .  | 287 |

*Chapter 19. Sunspots and faculae*

- |   |     |
|---|-----|
| 1. Introductory remarks. Radiative equilibrium in sunspots . . . . .                              | 290 |
| 2. The spectrum of a spot. The temperature. The electron pressure                                 | 292 |
| 3. Possible causes of the lower temperature in an spot. The magnetic fields in sunspots . . . . . | 298 |
| 4. Solar faculae. The depth distribution of temperature in a facula                               | 301 |
| 5. The spectra of faculae . . . . .   | 305 |

*Chapter 20. Prominences*

- |   |     |
|---|-----|
| 1. The classification of prominences . . . . .                        | 308 |
| 2. The motions of matter in prominences . . . . .                     | 313 |
| 3. The spectra of prominences . . . . .                               | 316 |
| 4. Self-absorption in prominences . . . . .                           | 317 |
| 5. The excitation of atoms in prominences . . . . .                   | 321 |
| 6. The ionisation of atoms. The electron pressure . . . . .           | 326 |
| 7. The kinetic temperature and chemical composition of prominences    | 330 |
| 8. A possible interpretation of the phenomena observed in prominences | 333 |

*Chapter 21. The chromosphere. Flocculi. Chromospheric flares*

- |   |     |
|---|-----|
| 1. The observational investigation of the height distribution of emitting atoms . . . . . | 341 |
| 2. Self-absorption. The law of the height variation of the density of matter . . . . .    | 346 |
| 3. The electron concentration. The electron temperature . . . . .                         | 349 |
| 4. The ionisation of atoms . . . . .  | 351 |
| 5. The mechanism of the excitation of atoms . . . . .                                     | 355 |
| 6. The equilibrium of the chromosphere . . . . .  | 358 |
| 7. The physics of flocculi . . . . .  | 361 |
| 8. Chromospheric flares . . . . .   | 372 |

*Chapter 22. The corona and the radio emission of the Sun*

- |  |     |
|--|-----|
| 1. General description and spectra . . . . .                     | 378 |
| 2. The electron concentration . . . . .                          | 381 |
| 3. The identification of coronal lines . . . . .                 | 385 |
| 4. The ionisation of atoms in the corona . . . . .               | 387 |
| 5. The chemical composition of the corona . . . . .              | 390 |
| 6. The ultra-violet radiation of the corona and the chromosphere | 392 |
| 7. The radio emission of the Sun . . . . .                       | 396 |

**Part IV. Planetary nebulae***Chapter 23. The mechanism of the radiation of the nebulae. The temperatures of their nuclei*

- |  |     |
|--|-----|
| 1. Observational data . . . . .  | 401 |
| 2. The origin of the radiation of the nebulae . . . . .                                | 402 |
| 3. The determination of the temperatures of the nuclei from hydrogen lines . . . . .   | 406 |
| 4. The determination of the temperatures of the nuclei from "nebulium" lines . . . . . | 411 |

*Chapter 24. The physical state of matter in the nebulae*

- |   |     |
|---|-----|
| 1. The conditions necessary for the appearance of forbidden lines . . | 413 |
| 2. The accumulation of atoms in metastable states . . . . .           | 416 |
| 3. The determination of the temperatures of the nebulae . . . . .     | 419 |
| 4. The intensities of the Balmer lines . . . . .                      | 421 |
| 5. Ionisation in the nebulae . . . . .                                | 425 |
| 6. The masses of the nebulae . . . . .                                | 429 |
| 7. The chemical composition of the nebulae . . . . .                  | 432 |

*Chapter 25. Radiative equilibrium in planetary nebulae*

|   |     |
|---|-----|
| 1. The Lyman continuum radiation field . . . . .                | 434 |
| 2. The Lyman $\alpha$ radiation field . . . . .                 | 438 |
| 3. Radiation pressure in the nebulae . . . . .                  | 443 |
| 4. The problem of the origin of the planetary nebulae . . . . . | 446 |

**Part V. Novae***Chapter 26. Nova outbursts and their interpretation*

|   |     |
|---|-----|
| 1. Observational data . . . . .                         | 448 |
| 2. The explanation of the observations . . . . .        | 451 |
| 3. The interpretation of the luminosity curve . . . . . | 455 |
| 4. The interpretation of the spectrum . . . . .         | 457 |
| 5. Nova Herculis 1934 . . . . .                         | 460 |

*Chapter 27. The part played by the ejected envelopes in the evolution of novae*

|   |     |
|---|-----|
| 1. The masses of the envelopes . . . . .                                  | 466 |
| 2. The dynamics of the envelopes . . . . .                                | 469 |
| 3. The energy evolved in the eruption . . . . .                           | 473 |
| 4. The part played by the eruption in the evolution of the star . . . . . | 474 |

**Part VI. Stars with bright spectral lines***Chapter 28. The formation of emission lines*

|   |     |
|---|-----|
| 1. Stars of the Wolf-Rayet, P Cygni, and Be types . . . . . | 478 |
| 2. The outflow of matter from the stars . . . . .           | 480 |
| 3. The emission-line contours . . . . .                     | 482 |
| 4. The emission-line intensities . . . . .                  | 489 |

*Chapter 29. Problems of the physics of stars with bright spectral lines*

|  |     |
|--|-----|
| 1. The temperatures of the stars . . . . .         | 497 |
| 2. The continuous spectrum . . . . .               | 503 |
| 3. Stars of late types with bright lines . . . . . | 512 |
| 4. Stellar associations . . . . .                  | 515 |

**Part VII. The internal structure of stars***Chapter 30. Basic facts*

|  |     |
|--|-----|
| 1. Statement of the problem . . . . .      | 520 |
| 2. The basic empirical relations . . . . . | 523 |

*Chapter 31. The physical conditions inside stars*

|  |     |
|--|-----|
| 1. The temperatures and densities of stellar cores . . . . . | 526 |
| 2. The absorption coefficient of stellar matter . . . . .    | 531 |
| 3. The sources of stellar energy . . . . .                   | 534 |

*Chapter 32. The internal structure of stars*

|  |     |
|--|-----|
| 1. The structure of stars of the main sequence . . . . .     | 541 |
| 2. The theory of the structure of the white dwarfs . . . . . | 544 |

**Part VIII. The scattering of light in planetary atmospheres***Chapter 33. The theory of radiative transfer in planetary atmospheres*

1. Radiative transfer in planetary atmospheres. The indicatrix of scattering . . . . . 550
2. The principle of invariance and its application . . . . . 555
3. Generalisation to the case of a non-spherical indicatrix of scattering 562

*Chapter 34. Comparison of theory and observation*

1. The albedo of a planetary atmosphere . . . . . 565
2. Comparison with observation . . . . . 567
3. Absorption bands. . . . . 571

**Part IX. Interstellar matter***Chapter 35. The dust component of interstellar matter*

1. Some basic facts . . . . . 573
2. Diffuse nebulae. . . . . 586
3. Fluctuations in the numbers of extragalactic nebulae . . . . . 595
4. The polarisation of starlight . . . . . 601
5. The general radio emission . . . . . 602

*Chapter 36. The gaseous component of interstellar matter*

1. The interstellar gas . . . . . 602
2. The formation of interstellar absorption lines . . . . . 606
3. The ionisation of the interstellar gas . . . . . 610
4. The  $H_{\alpha}$  radiation fields . . . . . 611
5. Giant gaseous nebulae . . . . . 613
6. The Crab nebula . . . . . 614

Appendices . . . . . 616

Bibliography . . . . . 623

Indexes . . . . . 633
