CONTENTS

I. THE EQUATION OF TRANSFER 1

1. Introduction 1

2. Definitions 1

2.1. The specific intensity 1

2.2. The net flux 2

2.3. The density of radiation 3

3. Absorption coefficient. True absorption and scattering. Phase function 5

4. The emission coefficient 7

5. The source function 8

6. The equation of transfer 8

7. The formal solution of the equation of transfer . . . 9

8. The equation of transfer for a scattering atmosphere. The flux integral for conservative cases 10

9. The equation of transfer for plane-parallel problems . . 11

10. Plane-parallel scattering atmospheres. The K-integral . . 13

11. Problems in semi-infinite plane-parallel atmospheres with a constant net flux 14

11.1. Isotropic case 15

11.2. The case of Rayleigh's phase function . . . 17

12. Axially symmetric problems in semi-infinite atmospheres and in non-conservative cases 18

13. Diffuse reflection and transmission 20

14. Problems with spherical symmetry 23

15. The representation of polarized light 24

15.1. An elliptically polarized beam 25

15.2. The Stokes parameters for an arbitrarily polarized light . 28

15.3. Natural light as a mixture of two independent oppositely polarized streams of equal intensity . . . 30

15.4. The representation of an arbitrarily polarized light as a mixture of two independent oppositely polarized streams . . 31

15.5. The law of transformation of the Stokes parameters for a rotation of the axes 34

16. Rayleigh scattering 35

17. The equation of transfer for an atmosphere scattering radiation in accordance with Rayleigh's Law 37

17.1. The equation of transfer for $I(\vartheta, \varphi)$ 38

17.2. The explicit form of the phase-matrix . . . 40

17.3. The equations of radiative transfer for an electron scattering atmosphere 43
17.4. The basic problem in the theory of the illumination of the sky 44
18. Scattering by anisotropic particles 45
19. Resonance line scattering 50
BIBLIOGRAPHICAL NOTES 52

II. QUADRATURE FORMULAE 54
20. The method of replacing the equations of transfer by a system of linear equations 54
21. The construction of quadrature formulae 57
22. Various special quadrature formulae 61
22.1. Gauss's formula 61
22.2. Radau's formula 63
22.3. The quadrature formula based on the zeros of the Laguerre polynomials 64
23. Quadrature formulae for evaluating mean intensities and fluxes in a stellar atmosphere 65
BIBLIOGRAPHICAL NOTES 68

III. ISOTROPIC SCATTERING 70
24. Introduction 70
25. The solution of the problem with a constant net flux under conditions of isotropic scattering 70
25.1. The solution of the equation of transfer in the nth approximation 70
25.2. Some elementary identities 73
25.3. A relation between the characteristic roots and the zeros of the Legendre polynomial 74
25.4. The flux and the K-integral 74
25.5. The source function. The radiation field. The law of darkening 75
25.6. The elimination of the constants and the expression of $I(0, \mu)$ in closed form. The H-function 77
25.7. The Hopf–Bronstein relation 77
25.8. The constants of integration 78
25.9. The numerical form of the solutions in the first four approximations 79
26. The problem of diffuse reflection. The case $\varpi_0 < 1$ . . 80
26.1. The solution of the associated homogeneous system . . 81
26.2. A particular integral 81
26.3. The solution in the nth approximation 82
26.4. An identity 83

26.5. The elimination of the constants and the expression of the law of diffuse reflection in closed form 84
27. The law of diffuse reflection in the conservative case . . 86
BIBLIOGRAPHICAL NOTES 87

IV. PRINCIPLES OF INVARIANCE 89
28. Principles of invariance 89
29. The mathematical formulation of the principles of invariance . 90
29.1. The invariance of the law of diffuse reflection . . 90
29.2. The invariance of the law of darkening . . . 91
29.3. An invariance arising from the asymptotic solution at infinity 92
30. The integral equation for the scattering function . . . 92
31. The principle of reciprocity 94
32. An integral equation between $I(0, \mu)$ and $S^{(0)}(\mu, \mu')$ . . 95
33. The explicit forms of the integral equations in the case of isotropic scattering 96
33.1. The integral equation for $S(\mu, \mu_0)$ 96
33.2. The law of darkening in the problem with a constant net flux 97
33.3. A derivation of the Hopf–Bronstein relation from the principles of invariance 98
34. The reduction of the integral equation for S for the case $p(\cos\Theta) = \varpi_0(1+x\cos\Theta)$ 99
34.1. The reduction of the equation for $S^{(0)}$ . . . 100
34.2. The expression of $S^{(1)}$ in terms of an H-function . . 101
35. The reduction of the integral equation for S for the case $p(\cos\Theta) = \frac{3}{4}(1+\cos^2\Theta)$ 101
36. The principles of invariance when the polarization of the radiation field is taken into account 103
BIBLIOGRAPHICAL NOTES 104

V. THE H-FUNCTIONS 105
37. Introduction 105
38. Integral properties of the H-functions 106
39. The relation of the H-function defined in terms of the Gaussian division and characteristic roots to the solution of the integral equation (1) 110
39.1. The representation of the solution of equation (32) as a complex integral 114
40. The explicit solution of the integral equation satisfied by $H(\mu)$. 115
41. A practical method for evaluating the H-functions . . 123
42. The H-functions for problems in isotropic scattering . . 124
BIBLIOGRAPHICAL NOTES 126

VI. PROBLEMS WITH GENERAL LAWS OF SCATTERING . 127

43. Introduction 127

44. The law of diffuse reflection for scattering in accordance with Rayleigh's phase function 128

44.1. The form of the solution for $S^{(0)}(\mu, \mu_0)$ . . . 129

44.2. The verification of the solution and the expression of the constant c in terms of the moments of $H(\mu)$ . . . 130

45. The law of darkening for the problem with a constant net flux and for Rayleigh's phase function 133

46. The law of diffuse reflection for scattering in accordance with the phase function $\varpi_0(1+x\cos\Theta)$ 135

46.1. The form of the solution for $S^{(0)}(\mu, \mu_0)$ . . . 136

46.2. The verification of the solution and the expression of the constant c in terms of the moments of $H(\mu)$ . . . 136

47. Illustration and comparison of the laws of diffuse reflection for the cases (i) isotropic scattering, (ii) Rayleigh's phase function, and (iii) the phase function $\varpi_0(1+x\cos\Theta)$ 140

47.1. The intensity of the light which has been scattered once . 145

48. The equation of transfer for a general phase function and its solution in the nth approximation 149

48.1. The equation of transfer for the problem of diffuse reflection and transmission and its reduction . . . 150

48.2. The equivalent system of linear equations in the nth approximation 151

48.3. The solution of the associated homogeneous system . . 151

48.4. A particular integral of the non-homogeneous system (94) . 154

48.5. The general solution of the system of equations (94) . . 156

48.6. The problem with a constant net flux in conservative cases . 156

48.7. The solution for the phase function $1+\varpi_1 P_1(\cos\Theta)+\varpi_2 P_2(\cos\Theta)$ 157

48.8. The exact solutions for the standard problems . . 158

BIBLIOGRAPHICAL NOTES 159

VII. PRINCIPLES OF INVARIANCE (*continued*) . . . 161

49. Introduction 161

50. The principles of invariance 161

51. Integral equations for the scattering and the transmission functions 166

52. The principle of reciprocity 171

53. The reduction of the integral equations (29)–(32) for the case in which the phase function is expressible as a series in Legendre polynomials 177

54. The integral equations for the case of isotropic scattering . . 180

BIBLIOGRAPHICAL NOTES 182

VIII. THE X- AND THE Y-FUNCTIONS 183
55. Definitions and alternative forms of the basic equations . . 183
56. Integro-differential equations for $X(\mu, \tau_1)$ and $Y(\mu, \tau_1)$ . . 184
57. Integral properties of the X- and Y-functions . . . 186
58. The non-uniqueness of the solution in the conservative case. The standard solution 190
58.1. Standard solutions 191
59. Rational representations of the X- and Y-functions in finite approximations 194
59.1. The elimination of the constants and the expression of the laws of reflection and transmission in closed forms . . 197
60. Solutions for small values of τ_1 202
60.1. The moments of $X^{(2)}(\mu)$ and $Y^{(2)}(\mu)$ 203
60.2. The correction of the approximate solutions . . . 204
60.3. The standard solutions 206
BIBLIOGRAPHICAL NOTES 207

IX. DIFFUSE REFLECTION AND TRANSMISSION . . 208
61. Introduction. Questions of uniqueness 208
62. The laws of diffuse reflection and transmission for isotropic scattering 209
62.1. A meaning for the X- and Y-functions . . . 211
62.2. The ambiguity in the solutions of the integral equations in the case $\varpi_0 = 1$ and its resolution by an appeal to the K-integral 212
62.3. The verification that Q satisfies the differential equation of Theorem 7, § 58 215
63. Approximate solutions for small values of τ_1 in the case of isotropic scattering 216
63.1. The approximate solution for the conservative isotropic case . 218
64. Diffuse reflection and transmission on Rayleigh's phase function . 219
64.1. The form of the solutions for $S^{(0)}(\mu, \mu_0)$ and $T^{(0)}(\mu, \mu_0)$. 221
64.2. Verification of the solution and a relation between the constants c_1 and c_2 222
64.3. The resolution of the ambiguity and the arbitrariness in the solution 224
64.4. The law of diffuse reflection and transmission . . 226
65. Diffuse reflection and transmission for scattering in accordance with the phase function $\varpi_0(1+x\cos\Theta)$ 227
65.1. The form of the solutions for $S^{(0)}(\mu, \mu_0)$ and $T^{(0)}(\mu, \mu_0)$. 228
65.2. Verification of the solution and the evaluation of the constants c_1 and c_2 in terms of the moments of $X(\mu)$ and $Y(\mu)$. 228
65.3. The law of diffuse reflection and transmission . . 230
66. Illustrations of the laws of diffuse reflection and transmission . 230
BIBLIOGRAPHICAL NOTES 232

X. RAYLEIGH SCATTERING AND SCATTERING BY PLANETARY ATMOSPHERES 233

67. Introduction 233

68. The problem with a constant net flux. The radiative equilibrium of an electron scattering atmosphere 234

68.1. The general solution of the equations of transfer in the nth approximation 235

68.2. The solution satisfying the necessary boundary conditions . 238

68.3. The characteristic roots and the constants of integration in the third approximation 240

68.4. The elimination of the constants and the expression of $I_l(0, \mu)$ and $I_r(0, \mu)$ in terms of H-functions 241

68.5. Relations between the constants q and c 245

68.6. Passage to the limit of infinite approximation and the exact solutions for $I_l(0, \mu)$ and $I_r(0, \mu)$ 246

68.7. The exact laws of darkening in the two states of polarization. The degree of polarization of the emergent radiation . 247

69. The reduction of the equation of transfer for the problem of diffuse reflection and transmission 249

70. The law of diffuse reflection by a semi-infinite atmosphere for Rayleigh scattering 254

70.1. The form of the solution for $S^{(0)}(\mu, \mu')$ 255

70.2. Verification of the solution and the expression of the constants q and c in terms of the moments of $H_l(\mu)$ and $H_r(\mu)$. . 256

70.3. The law of diffuse reflection 259

70.4. The law of diffuse reflection of an incident beam of natural light 261

71. The law of diffuse reflection and transmission for Rayleigh scattering 265

72. The fundamental problem in the theory of scattering by planetary atmospheres and its solution in terms of the standard problem of diffuse reflection and transmission 269

72.1. The reduction to the standard problem in case of scattering according to a phase function 270

72.2. Illustrations of the formulae of § 72.1 274

72.3. The reduction to the standard problem in case of scattering according to a phase-matrix 275

72.4. Expressions for $\gamma_l^{(1)}(\mu)$, $\gamma_r^{(1)}(\mu)$, $s_l(\mu)$, $s_r(\mu)$ and $\bar{s}$ in the case of Rayleigh scattering 280

73. The intensity and polarization of the sky radiation . . 280

74. Resonance line scattering and scattering by anisotropic particles . 282

BIBLIOGRAPHICAL NOTES 286

XI. THE RADIATIVE EQUILIBRIUM OF A STELLAR ATMOSPHERE 288

75. The concept of local thermodynamic equilibrium . . . 288

76. The radiative equilibrium of a stellar atmosphere in local thermodynamic equilibrium 289

77. The method of solution 291

78. The temperature distribution in a grey atmosphere . . 293

79. The temperature distribution in a slightly non-grey atmosphere . 296

79.1. The solution in the (2, 1) approximation . . . 299

79.2. The solution in the (2, 2) approximation. . . . 300

80. The nature and the origin of the stellar continuous absorption coefficient as inferred from the theory of radiative equilibrium . 303

80.1. The method of analysis and inference . . . 304

80.2. The continuous absorption coefficient of the solar atmosphere 307

80.3. The negative hydrogen ion as the source of continuous absorption in the atmospheres of the sun and the stars . . 308

81. Model stellar atmospheres 311

81.1. A model solar atmosphere in the (2, 1) approximation . 312

81.2. A model solar atmosphere in the (2, 2) approximation . 313

81.3. Model atmospheres in higher approximations . . 314

BIBLIOGRAPHICAL NOTES 315

XII. FURTHER ASTROPHYSICAL PROBLEMS . . . 318

82. Introduction 318

83. Schuster's problem in the theory of line formation . . . 318

83.1. The case $I^{(s)}(\tau_1, +\mu) = I^{(0)} + I^{(1)}\mu$ 319

84. The theory of line formation, including the effects of scattering and absorption 321

84.1. The solution of the equation of transfer (24) in the nth approximation 322

84.2. The elimination of the constants and the expression of the solution in closed form 323

84.3. Passage to the limit of infinite approximation . . 325

84.4. The evaluation of $\lim_{n\to\infty}\left(\sum_{\alpha=1}^{n} k_\alpha^{-1} - \sum_{j=1}^{n}\mu_j\right)$. The exact solution 326

84.5. Exact formulae for the residual intensity . . . 327

85. The softening of radiation by multiple Compton scattering . 328

85.1. The equation of transfer and its approximate form . . 329

85.2. The reduction to a boundary-value problem . . . 331

85.3. The solution of the boundary-value problem . . 332

85.4. The spectral distribution of the emergent radiation . . 332

86. The broadening of lines by electron scattering . . . 334

86.1. The Fourier transform of equation (118) . . . 338
86.2. The solution of equation (124) in the first approximation . 339
BIBLIOGRAPHICAL NOTES 342
XIII. MISCELLANEOUS PROBLEMS 344
87. Introduction 344
88. An example of a problem in semi-infinite atmospheres with no incident radiation and in non-conservative cases . . 344
89. The relation of H-functions to solutions of integral equations of the Schwarzschild–Milne type. The 'pseudo-problems' in transfer theory 346
89.1. The H-function in conservative cases as the Laplace transform of the solution of an integral equation of the Schwarzschild–Milne type 347
89.2. The relation between H-functions and the Laplace transforms of solutions of integral equations of the Schwarzschild–Milne type in non-conservative cases 349
89.3. The 'pseudo-problems' in transfer theory . . . 351
90. The diffusion of imprisoned radiation through a gas . . 354
90.1. The equations of the problem 354
90.2. The general method of solution 357
90.3. The form of the solution in finite approximations . . 360
90.4. The solution in the first approximation . . . 363
91. The transfer of radiation in atmospheres with spherical symmetry. 364
91.1. The solution in the first approximation . . . 366
91.2. The equations for the second approximation . . . 367
91.3. The solution of the equations in the second approximation for the case $\kappa\rho \propto r^{-n}$ $(n > 1)$ 368
BIBLIOGRAPHICAL NOTES 371
APPENDIX I 373
92. The exponential integrals 373
93. The functions $F_j(\tau, \mu)$ 375
94. The integrals $G_{n.m}(\tau)$ and $G'_{n,m}(\tau)$ 376
BIBLIOGRAPHICAL NOTES 378
APPENDIX II 379
95. A problem in interpolation theory 379
APPENDIX III 383
96. The problem in semi-infinite atmospheres with no incident radiation and for scattering according to the phase function $\varpi_0(1+x\cos\Theta)$ 383
SUBJECT INDEX 386
INDEX OF DEFINITIONS 392
