

Contents

<i>Preface</i>	7
1 INTRODUCTION	9
The waves used by optical astronomers – The radio window – Some advantages of radio waves – The early history of radio astronomy – The world's large radio telescopes – The future of radio astronomy	
2 THE TECHNIQUES OF RADIO ASTRONOMY	22
The radiation received – The basic measuring equipment – Aerials – Receivers – Advanced systems	
3 THE GENERATION AND PROPAGATION OF RADIO WAVES	39
The theory of propagation – Thermal emission from hot plasma – Magnetic acceleration emission – The two forms of Cerenkov emission – Electric space-charge waves and clouds – Emission beyond the black-body limit	
4 THE CONTINUOUS-SPECTRUM COSMIC RADIATION	55
The surveys of cosmic radiation – The Galaxy – Discrete sources within the Galaxy – External galaxies	
5 HYDROGEN LINE EMISSION	74
Hydrogen line spectrographs – The structure of the Galaxy – Atomic hydrogen in other galaxies – Discrete galactic sources	

6	RADIO WAVES FROM THE SUN	85
	The quiet Sun – The slowly-varying radio emission – Radio bursts – Emission from streaming gas – Broad- band radio bursts and noise storms	
7	RADIO WAVES FROM THE MOON, THE PLANETS, ROCKETS AND SATELLITES	105
	Radiation from the Moon – Thermal radiation from the planets – Non-thermal radiation from Jupiter – Signals from rocket-launched transmitters	
8	RADAR ASTRONOMY	113
	Meteor astronomy – Radar echoes from the Moon – Radar studies of the planets – Other astronomical radar studies	
	<i>Glossary</i>	124
	<i>Index</i>	127

Plates

I	The Owens Valley (California) radio telescope	32
II	The Great Nebula in Andromeda (M31)	33
III	(a) The Lagoon Nebula, (b) The Crab Nebula, (c) The closest 'radio galaxy' Centaurus A, (d) The 'radio galaxy' Virgo A	64
IV	Four stages in the ejection of a prominence from the Sun's atmosphere	65
