

INDICE

A. MOLINARI and R. A. RICCI – Foreword	pag. XI
Gruppo fotografico dei partecipanti al Corso	fuori testo
E. AMALDI – A few flashes on Hans Bethe contributions during the thirties	» 1
I. TALMI – Effective interactions and nuclear models	» 17
J. W. NEGELE – Path integrals and nuclear structure.	
1. Introduction	» 32
2. Mean-field theory	» 33
2'1. Static Hartree-Fock approximation	» 33
2'2. Time-dependent Hartree-Fock approximation	» 38
3. Path integrals for nuclear collective motion	» 47
3'1. Path integral with a single degree of freedom	» 47
3'2. The many-fermion problem	» 53
3'3. Schematic results	» 58
4. Stochastic evaluation of path integrals	» 63
4'1. Guided random walks	» 63
4'2. Many-nucleon problem with a static potential	» 67
4'3. Meson-nucleon field theory	» 69
4'4. Lattice gauge theory	» 72
4'5. Confining quark model	» 75
5. Summary and conclusions	» 78
MANNQUE RHO – Chiral bags, Skyrmions and quarks in nuclei.	
1. Introduction	» 82
2. Chiral bags and quantized parameters	» 82
2'1. Leaking baryon charge	» 82

2'2.	The Skyrmion	pag.	85
2'3.	Is the $R = 0$ chiral bag a Skyrmion?	»	88
2'4.	Quantized parameters in effective theories	»	90
	2'4.1. Side remark on chiral anomalies.	»	90
2'5.	Testing the Wess-Zumino term	»	94
3.	Can a Skyrmion be derived from a chiral bag?	»	94
	3'1. Goal	»	94
	3'2. «Cheshire cat» picture	»	95
	3'2.1. The subtraction procedure	»	96
	3'2.2. Some results	»	99
	3'2.3. An interpretation	»	101
4.	The vector mesons in the chiral bag	»	103
	4'1. The vector mesons in nuclear physics	»	103
	4'2. Skyrme's quartic term	»	103
	4'2.1. Testing the quartic term	»	103
	4'2.2. Is ε^2 quantized?	»	105
	4'3. The vector mesons in the Skyrmons	»	106
	4'4. Level crossing and Skyrme's quartic term	»	107
	4'5. Quark bag and Skyrme's quartic term.	»	110
5.	Some consequences in nuclear physics	»	110
6.	Other developments.	»	111

H. FESHBACH – Statistical theory of multistep reactions.

1.	Introduction	»	116
2.	An important theorem	»	120
3.	Theoretical results	»	127
4.	Applications	»	133

T. E. O. ERICSON – Pions in nuclei.

1.	Introduction	»	142
2.	A historical interlude	»	144
3.	The one-pion exchange potential.	»	145
4.	The OPEP pole	»	146
5.	The P -wave \mathcal{NN} scattering volumes.	»	147
6.	The deuteron wave function.	»	149
7.	The deuteron D/S ratio and quadrupole moment	»	151
8.	Pions in the nuclear medium	»	157
9.	Possibility of pion condensation	»	158
10.	A schematic model for a finite nucleus.	»	158
11.	Realistic nucleus	»	159
12.	Nuclear «Gamow-Teller» states	»	161
13.	Nuclear axial currents and pion physics	»	164
14.	Conclusion	»	168

L. VAN HOVE – Nuclear matter under extreme conditions and the early Universe.

1. Introduction	pag. 170
2. QCD strings and the deconfinement transition	» 172
3. Quark-gluon plasma droplets in high-energy collisions	» 173
4. The hadronic phase transition in the early Universe.	» 175

H. A. BETHE – Supernova theory.

1. Introduction	» 181
2. The result of the supernovae	» 182
3. Pre-SN configuration.	» 183
4. Entropy	» 183
5. Start of collapse	» 184
6. Electron capture	» 184
7. Neutrino trapping	» 186
8. Energy and entropy	» 187
9. Dynamics	» 188
10. Equation of state	» 189
11. Start of the shock	» 191
12. Cooperstein's shock calculations	» 192
13. Success and failure	» 194
14. Net ram pressure.	» 195
15. Low-mass supernovae	» 198
16. Larger-mass supernovae	» 201
17. Revival of shock by neutrino heating	» 202
18. Conclusions	» 208

B. COPPI – Heliosphere, collapsed stars and fusion reactors. » 210

H. MORINAGA – Direct neutron capture and element synthesis.

1. Introduction	» 212
2. Physics of the direct neutron capture	» 213
2'1. Occurrence	» 213
2'2. Gamma-ray spectrum following neutron capture	» 213
2'3. Direct-capture calculation.	» 214
3. Multiple neutron capture and direct neutron capture	» 217
4. Direct neutron capture and <i>r</i> -process path	» 219

P. ARMBRUSTER – Discovery of element 108. The island of α -active nuclei beyond element 105.

1. Introduction	» 222
2.	» 223

2'1. Discovery of element 108 via synthesis and detection of $^{265}108$	pag. 223
2'2. The isotope $^{259}106$	» 225
2'3. The even-even isotope $^{260}106$	» 225
2'4. Experimental mass excesses, shell corrections and fission barriers	» 227
3. On the cooking of new elements	» 233
3'1. The dynamical hindrance	» 233
3'2. The thermal hindrance	» 235
4. Perspectives of going beyond $Z = 109$	» 238

M. HACK – Observational evidence of element formation processes in stars.

1. Introduction	» 241
2. Chemical composition of unevolved stars	» 242
2'1. Standard chemical composition	» 244
2'2. Metallicity <i>vs.</i> age	» 245
2'3. Chemical composition of globular clusters	» 246
3. The problem of the missing zero-metal population	» 248
4. Chemical composition of the ISM	» 249
5. The abundance of deuterium	» 251
6. ^3He abundance	» 252
7. Li and Be abundances	» 252
8. Evolved stars	» 254
8'1. Algol-type binaries	» 254
9. Conclusion	» 255

M. ERICSON – Pionic properties of nuclei.

1. Fermi gas with interactions	» 259
2. Low-energy region	» 261

MIKKEL B. JOHNSON – What are we learning about nuclei with pions at LAMPF? » 267

A. COVELLO – Number-conserving approach to the pairing-force problem.

1. Introduction	» 299
2. Outline of method	» 299
3. First-order theory	» 301
3'1. Seniority-zero states	» 301
3'2. Seniority-one states	» 302
3'3. Seniority-two states	» 302

4. Numerical results. pag. 303
 5. Concluding remarks. » 307

R. GALLINO and M. BUSO – On the production of heavy neutron-rich isotopes during He and C burning in massive stars.

1. Introduction » 309
 2. He-burning phases in massive stars » 310
 3. C-burning phases in massive stars » 315
 4. s-processes or n-processes?. » 321
 5. Conclusions » 321
