G. CINI CASTAGNOLI - Introduction	pag. xiii
D. S. INTRILIGATOR - Our present knowledge of the heliosphere.	
1. Introduction	» 1
2. Sun	» 7
3. The interplanetary medium	» 10
3'1. Elemental abundance.	» 15
3'2. Interplanetary magnetic field	» 16
3'3. The distant solar wind	» 19
4. Transient phenomena originating at the Sun	» 25
4'1. The December 1978 events	» 25
4'2. The April/May 1978 events at Pioneer 10 and 11 . .	» 28
4'2.1. Energetic-particle trapping by interplanetary shocks	» 28
4'2.2. Longitudinal asymmetries in interplanetary shock and energetic-particle propagation	» 32
4'2.3. Cosmic-ray modulation by interplanetary shocks	» 34
4'3. The August 1972 events at Pioneer 9 and 10	» 36
4'4. Modeling the radial propagation of transient events . .	» 37
5. Solar-wind turbulence and fluctuations	» 38
6. Study of the isotopes of solar-flare nuclei.	» 42
7. Magnetosphere-ionosphere system.	» 43
7'1. Magnetospheric plasma	» 44
7'2. Aurora	» 45
7'3. Plasma waves	» 48
7'4. Magnetosphere-atmosphere coupling	» 49
7'5. Plasma boundaries	» 50
7'6. The extended geomagnetic tail	» 51
H. FRIEDMAN - Solar radiation in the near-Earth environment.	
1. Solar ionizing radiation and the ionosphere	» 56
2. Solar X-rays and ultraviolet.	» 57

3.	Interaction of solar radiation with the atmosphere	pag. 61
4.	Absorption by oxygen	» 62
5.	Absorption by nitrogen	» 64
6.	X-ray absorption in air	» 64
7.	Formation of the ionosphere.	» 66
8.	Ionic reactions and electron loss processes	» 67
9.	Effective recombination coefficient from eclipse observations	» 69
10.	<i>D</i> region variability	» 71
11.	Sudden ionospheric disturbances	» 72
12.	Sudden phase anomalies.	» 74
13.	Winds, waves and drifts	» 75
14.	The global electric circuit	» 76
15.	Structure of the neutral atmosphere	» 79
15'1.	The troposphere	» 79
15'2.	Greenhouse gases	» 79
15'3.	Stratosphere.	» 80
15'4.	Ozone chemistry and dynamics	» 81
15'5.	The mesosphere	» 82
15'6.	Thermosphere	» 82
15'7.	Exosphere.	» 83
15'8.	The geocorona.	» 83
16.	The Sun's nonionizing radiation and climate	» 83
16'1.	The solar constant.	» 83
16'2.	Sun and climate.	» 85
16'3.	Vulcanoes and climate	» 87
17.	Cosmic encounters with interstellar dust	» 88

D. O. GOUGH – Theory of solar variation.

1.	Introduction	» 90
2.	Time scales	» 92
2'1.	Dynamical	» 93
2'2.	Thermal	» 93
2'3.	Nuclear	» 93
2'4.	Convective	» 94
2'5.	Other diffusive time scales	» 95
2'6.	Rotation period	» 95
2'7.	Solar cycle	» 95
3.	Nuclear reactions	» 95
4.	Main-sequence evolution of the Sun	» 98
5.	Calibrating solar models.	» 102
6.	Solar spin-down	» 105
7.	The solar spoon	» 110
8.	The solar cycle.	» 116
8'1.	The sunspot record	» 117

8'2. Proxy records	pag.	121
8'3. On the Sun's internal magnetic field	»	122
9. Seismological diagnostics	»	123
9'1. Stratification	»	124
9'2. Rotation	»	127
10. Concluding remarks	»	127

F. R. STEPHENSON — Evidence for solar variability from historical records.

1. Introduction	»	133
2. Measurements of the solar diameter	»	134
3. Observations of the form of the solar corona	»	136
4. Observations of sunspots	»	137
5. Observations of aurorae	»	143
6. Conclusion	»	149

F. R. STEPHENSON — The history of the Earth's rotation as determined from eclipses and occultations.

1. Introduction	»	151
2. Lunar and solar tidal torques	»	151
3. The lunar acceleration and the tidal rate of lengthening of the day	»	153
4. Changes in the LOD as determined from telescopic observations	»	155
5. An outline of pre-telescopic observations	»	158
5'1. Babylon	»	158
5'2. China	»	159
5'3. The Arab Dominions	»	160
5'4. Europe	»	160
6. Changes in the LOD as determined from pre-telescopic observations	»	161
7. Conclusion	»	164

F. R. STEPHENSON — Historical supernovae.

1. Introduction	»	166
2. The identification of supernovae from among early records of new stars	»	167
2'1.	»	167
2'2.	»	167
2'3.	»	168
2'4.	»	169
3. The supernova of A.D. 1006	»	170

4. The supernova of A.D. 1054	pag. 171
5. The supernova of A.D. 1181	» 173
6. The spurious SN of A.D. 1408	» 175
7. The supernova of A.D. 1572	» 177
8. The new star of A.D. 1592	» 178
9. The supernova of A.D. 1604	» 178
10. False sightings of new stars in A.D. 1600 and 1664	» 179
11. Cas A and its associated SN.	» 181
12. Conclusion	» 181
J. BEER – Radioisotopes in natural archives: information about the history of the solar-terrestrial system.	
1. Introduction	» 183
2. Production of radioisotopes in the atmosphere	» 184
3. Archives	» 186
3'1. Polar ice sheets, glaciers	» 186
3'2. Deep-sea sediments	» 187
3'3. Tree rings.	» 188
4. Experimental.	» 188
5. Results	» 191
H. E. SUESS – Radiocarbon in tree rings	» 199
G. CINI CASTAGNOLI – Stability of the cyclic behaviour of the Sun in the past millennia.	
1. Introduction	» 205
2. The solar records.	» 205
3. The 11 y cycle in the terrestrial records	» 207
4. The secular variations	» 212
D. LAL – Theoretically expected variations in the terrestrial cosmic-ray production rates of isotopes.	
1. Introduction	» 216
2. Theoretical estimates of the time variations in isotope production rate due to change in solar activity	» 218
2'1. Solar modulation of galactic-cosmic-ray flux and isotope production rates for different geomagnetic-dipole field strengths	» 218
2'2. Solar-flare production of ^{14}C and ^{10}Be	» 229
3. Conclusions	» 230

D. LAL – Interesting geophysical applications of terrestrial long-lived cosmogenic stable and radioactive isotopes.

1. Introduction	pag. 234
2. Atmospheric and <i>in situ</i> cosmic-ray-produced isotopes	» 235
3. Interpretation of data on cosmogenic «atmospheric» radio-isotopes	» 236
4. Interpretation of <i>in situ</i> cosmogenic record	» 239
5. Information from long time series of atmospheric cosmogenic isotopes	» 240
6. Conclusions	» 241

M. GALLI – Time series analysis with power spectrum and cyclograms.

1. Introduction	» 246
2. The power spectrum theory	» 246
2'1. The discrete Fourier transform (D.F.T.)	» 246
2'2. The power spectral density (p.s.d.) or periodogram of a time series	» 247
2'3. The estimate of the p.s.d. of a discrete random process	» 248
2'4. The direct and indirect methods of estimating the p.s.d.	» 249
2'5. The cross-spectral density (c.s.d.)	» 249
2'6. Significance of peaks in the p.s.d.	» 249
3. The cycrogram analysis	» 250
3'1.	» 250
3'2. Finding the time of maxima of a sine wave component	» 253
3'3. Independence of two points of a cycrogram	» 253
3'4. The extension of a sum of n Gaussian vectors	» 254
3'5. The cycrogram when there are only a few data per period τ	» 256
3'6. P.s.d. of series of nonequispaced data	» 256
3'7. Cycrogram and p.s.d. of a series	» 256
3'8. The significance level of the random-vector hypothesis	» 258
4. Frequency response of a cycrogram	» 258
5. The cycrogram of the sum of two sine waves	» 265
6. The cross-cycrogram	» 268
Appendix A	» 269
Appendix B	» 272

C. P. SONETT – Time series, radiocarbon and varves.

1. Prologue	» 274
2. Introduction and definitions	» 274
3. Independence and interdependence	» 276

4.	Correlation	pag. 278
5.	Structure of the time series	» 279
5'1.	Stationarity	» 280
5'2.	Ergodicity	» 280
6.	Convolution	» 281
7.	Fourier transforms	» 282
7'1.	Special function	» 283
8.	Sampling	» 285
8'1.	Dual-rate sampling	» 286
8'2.	Other sampling codes	» 287
9.	Filtering	» 288
10.	Autocovariance	» 289
11.	Time-progressive parametrizations	» 290
11'1.	Time-progressive correlations	» 290
11'2.	The cyclogram	» 291
12.	Modulation	» 291
12'1.	Amplitude modulation (AM)	» 292
12'2.	Frequency modulation	» 293
13.	The Sun	» 294
14.	Varves	» 296
14'1.	Skilak Lake	» 298
14'2.	Elatina varves	» 300
14'3.	Weeli-Wooli varves	» 301
14'4.	Scotland	» 301
15.	Radiocarbon	» 303
15'1.	La Jolla ^{14}C and the bristlecone pine ring growth record	» 306
15'2.	^{14}C and the Earth's magnetic field	» 307
15'3.	Misc	» 309
S.	K. RUNCORN – Geomagnetism and palaeomagnetism: an outline.	
1.	The geomagnetic field	» 312
1'1.	Introduction	» 312
1'2.	Potential theory	» 312
1'3.	The core dynamo	» 313
2.	Palaeomagnetism and archeomagnetism	» 314
G.	CINI CASTAGNOLI and G. BONINO – Thermoluminescence in sediments: a tool for environmental investigations.	
1.	Introduction	» 317
2.	TL dating of sediments	» 318

3. TL profiles in marine cores	pag.	322
3'1. Experimental method	»	322
3'2. Comparison of $TL(t)$ in different cores and its periodical character	»	324
4. Conclusions	»	327

H. OESCHGER – The global carbon cycle, a part of the Earth system.

1. Introduction	»	329
2. Tracers in the Earth system	»	330
3. The global carbon cycle and its isotopic labelling	»	332
4. Anthropogenic disturbances of the carbon cycle	»	334
4'1. The anthropogenic CO_2 input into the atmosphere . .	»	335
4'2. The atmospheric CO_2 increase	»	335
5. Natural variations of the carbon cycle	»	339
5'1. ^{14}C variations during the last 8000 years	»	339
5'2. The carbon cycle in the last glaciation and in the transition to the Holocene	»	342
6. Conclusions	»	340
Appendix. – Estimates of the response of the carbon system to atmospheric perturbations	»	340

J.-P. LEGRAND et P.-A. SIMON – Les principales sources solaires de l'activité géomagnétique et leur relation au cycle à l'échelle séculaire.

1. Introduction	»	353
2. Méthode de travail	»	354
3. Résultats	»	356
3'1. L'activité géomagnétique récurrente	»	356
3'2. L'activité géomagnétique transitoire	»	364
3'2.1. L'activité de chocs	»	365
3'2.2. L'activité des jets de vent solaire fluctuants . .	»	371
3'3. L'activité magnétique des jours calmes	»	371
4. Conclusions	»	374

J. GUIOT – Climate of the Hudson Bay region and effects of solar activity, volcanic dust and lunar nodal tidal signal.

1. Introduction	»	377
2. Variability study	»	378
3. Autoregressive analysis and quasi-cycles	»	380

4. Multivariate autoregressive analysis	pag. 383
5. Separation of 18.6- and 22-year components	» 385
6. Study of the beat wave between the 18.6- and 22-year periods	» 390
7. Concluding remarks	» 393
 M. A. SHEA and D. F. SMART – Cosmic rays and solar activity since 1955.	
1. Background	» 396
2. Relationship between the cosmic-radiation intensity and solar cycles	» 396
3. North/South asymmetry in solar activity	» 400
4. Cosmic-radiation data	» 402
5. Discussion	» 405
6. Summary	» 406
 N. IUCCI, M. PARISI, M. STORINI and G. VILLORESI – Large-scale interplanetary perturbations and their influence on the galactic cosmic-ray modulation.	
1. Introduction	» 408
2. Flare-associated disturbances and Forbush decreases	» 408
2'1. Front edge perturbation	» 414
2'2. Western edge of the modulated region	» 419
2'3. Eastern edge of the modulated region	» 421
2'4. The space-time evolution of a FD-producing interplanetary perturbation	» 423
3. Interplanetary perturbations coming from coronal holes and the associated galactic cosmic-ray modulation	» 425
3'1. Time behaviours of the interplanetary parameters during a RHSS passage at the Earth	» 425
3'2. Galactic CR modulation during RHSS periods	» 425
4. The eleven-year galactic cosmic-ray modulation	» 429
4'1. The incidence of the long-term changes of the interplanetary parameters	» 430
4'2. A dynamic relation between the galactic CR modulation and solar activity	» 431
4'3. Other simulations of the 11-year galactic CR modulation	» 434
 O. VITTORI – The thermal balance of the Earth.	
1. The planetary heat balance	» 438
2. The overall radiation balance in the system	» 439
3. The mean thermal balance in the system	» 440
4. Concluding remarks	» 442
