

CONTENTS

PREFACE	v
CONTENTS	xvi
 Chapter I: FUNDAMENTAL EQUATIONS OF DIFFRACTION OF WAVE FIELDS	1
1. Photons. Kirchhoff's theorem and Fraunhofer diffraction	2
2. X-rays. Maxwell's theory and Thomson's scattering formula.	8
3. Schrödinger's theory and the Born-Mott approximation	14
4. Diffraction of neutrons by single atoms. Fermi-Born factor	19
5. Intensity function and Fourier space	21
6. Ewald's sphere of reflexion. Phase problem and Q -function	23
7. Diffraction microscopy and Abbe's theory of lenses.	27
8. Some remarks about the dynamical interference theory, Doppler and Compton effects, absorption factors and anomalous dispersion	29
9. Dynamical interference theory of Ewald, v. Laue and Lamla	34
 Chapter II: CONVOLUTION OPERATIONS	40
1. General properties of convolution products.	41
2. General properties of convolution square.	46
3. Folding machine and optical illustrations	47
4. Calculation of one-dimensional convolution products	60
4.1 Dirichlet's step functions	60
4.2 The function $g(t) = \sin 2\pi vt/\pi t$	61
4.3 Gaussian function	62
4.4 Convolution product of a Gaussian function with Dirichlet's step function	64
5. Calculation of multidimensional convolution products	65
5.1 Convolution square of a circle	65
5.2 Convolution square of a sphere	65
5.3 Convolution square of a rectangular parallelepiped	66
5.4 Convolution product of two Gaussian functions.	66
5.5 Convolution product of a Gaussian function with a shell function . .	67
5.6 Convolution product of orthogonal straight line functions	68
5.7 Three-dimensional convolution product of a Gaussian function and a spherically symmetrical function.	69
6. Physical significance of convolution operations	70
6.1 The law of propagation of errors	70
6.2 The precision of measurement.	72
6.3 The collimation error or instrumental broadening	73
6.4 Superposition of tolerances. The "window".	74
6.5 Convolution square and convolution square root	75
 Chapter III: FOURIER TRANSFORMATION	76
1. The analysis of a temporal phenomenon with the help of its frequency spectrum	76
2. Definition of multidimensional Fourier transformation.	79
3. The affine transformation. The normalised \mathbf{p} - and \mathbf{h} -space	82

4. General properties of Fourier transforms	86
4.1 Fourier's integral theorem	86
4.2 Shift theorem of Fourier transforms	87
4.3 Convolution theorem of Fourier transforms	87
4.4 Some other integral properties	88
4.5 Symmetry properties of Fourier transforms	89
5. Fourier transformation and convolution square	91
6. Fourier transform of a spherically symmetrical function	91
7. Fourier transform of cylindro-symmetrical functions. The transform of a helix	92
8. Shape function and shape amplitude	96
8.1 Dirichlet's step function	96
8.2 The shape amplitude of a rectangle	98
8.3 The shape amplitude of a parallelepiped	99
8.4 The shape amplitude of a circle	100
8.5 The shape amplitude of a sphere	102
8.6 The shape amplitude of an ellipsoid of revolution	102
9. Abbe transformation	103
9.1 The shape amplitude of a tetrahedron	105
9.2 The shape amplitude of an octahedron	108
10. The integral width of the shape factor	109
11. The generalised Guinier-approximation and the shape tensor	112
 Chapter IV: CONVOLUTION POLYNOMIALS	 120
1. Multiple convolution products and convolution square roots	120
1.1 Multiple folding operations	120
1.2 Convolution square root	121
2. The characteristic convolution square root	122
3. The paracrystalline convolution polynomial for coordination statistics	131
4. The ideal paracrystalline convolution polynomial	138
5. The steps of folding operations. The elementary cell	140
6. Experimental verification of the relation between lattice statistics and coordination statistics	143
7. The convolution quotient. Southwell's method of relaxation	147
 Chapter V: FUNDAMENTALS OF FUNCTION ALGEBRA	 152
1. The mathematical necessity of a function algebra	152
2. Physical necessity of function algebra	153
3. Definition of a function complex. Laurent Schwartz's theory	156
4. The function complex of point functions	160
5. Fourier transform of function complexes	166
6. Integro-differential operator	171
7. Jordan's theorem. Integration through the pole	175
8. Fourier transform of one-dimensional functions	181
9. Fourier transforms of some important functions	193
10. The universal validity of the integral theorem of Fourier transformation for a function complex	195
 Chapter VI: FUNDAMENTALS OF DIFFRACTION MICROSCOPY	 198
1. Observable properties of the intensity function and of the Q -function	198
2. Termination effect and resolving power	202
3. Visible and invisible ghosts	203
4. The expectation value of Q - and intensity function. Rayleigh-scattering	208
5. "Frozen" structures, ξ -average and time-average	211

Chapter VII: GENERAL BASIC PROPERTIES OF A STRUCTURE.	216
1. The Q -function of a point structure. The distance statistics $z(x)$ of a point structure	216
2. The intensity function of a point structure. The separation of the shape factor from the distance statistics factor.	219
3. Theorem of Ornstein-Zernike. Small angle scattering and clusters	220
4. General properties of a particle structure. The interaction zone	225
5. Lattices and partial correlations	229
6. Superlattices	234
7. Atom factor, brick factor and lattice factor. Clusters	236
8. Lattice distortions of the first and second kind. Dislocation factor.	239
9. The general intensity formulae. Debye's volume scattering. Cooperative forces	246
 Chapter VIII: THE SINGLE CRYSTAL	 252
1. The function complex of the crystalline lattice factor. Laue conditions	252
2. Miller indices and Bragg law	258
3. Structure factor. Laue's method of determining the shape and size of a crystallite. Practical crystallography.	260
4. Fourier and Patterson synthesis of crystals. Sharpening of the map	264
5. Ideal mixed crystal	270
6. Thermal distortions of the lattice. The Debye-Waller temperature factor	271
7. The Lorentz factors	278
7.1 Stationary crystal in a polychromatic primary beam. Laue pattern	279
7.2 Oscillation diagrams with monochromatic primary radiation (Schiebold and Polanyi)	280
7.3 The oscillating method of Bragg and Darwin.	282
7.4 Powder diagrams of crystals (Debye-Scherrer pattern).	284
8. Extra Laue spots. Laval's theory. Doppler effect. Laue's temperature factors	286
9. Line profiles and line breadths. Background analysis	291
9.1 Line broadening of strained crystallites	294
9.2 Line profiles, antiferromagnetic crystals and thermal vibrations	298
9.3 Background scattering	299
 Chapter IX: THE SINGLE PARACRYSTAL	 302
1. Statistical correlations and partial statistics	302
2. The ideal paracrystalline lattice factor. Generalised Laue conditions	305
3. The paracrystalline lattice factor. Correlation factors	310
4. Coordination statistics, lattice cell and valence bonds.	315
5. Discussion of K -factor	322
6. Interaction zone and composite reflexions	331
7. Crystalline and diffuse reflexions. Generalised Bragg law	337
8. Degenerate cases of crystals, liquids and gases.	342
9. Small angle scattering of a single paracrystal. The cluster term	346
10. Crystals with statistical stacking faults	350
 Chapter X: COMPTON SCATTERING. THE SINGLE ATOM AND ELECTRON	354
1. Einstein's frequency relation and de Broglie's wavelength relation	354
2. Compton's theory of particle scattering	355
3. Semi-wavemechanical treatment. The recoil factor	358
4. The conventional and generalised atom factor. Raman's fluctuation term. The electron factor	363
5. The single atom. The correlation term	367

6. The conventional quantum mechanical calculation of Wentzel	369
7. The cross-section of atoms and electrons	372
8. Structure analysis of bound electrons by means of diffraction and spectroscopy	374
9. S-matrix and classical theory of Raman-Compton	379
10. Some aspects of refinement of the theory of thermal oscillations	381
11. A two-dimensional model structure with individual atoms and discrete electrons. ξ -average and spectral analysis	382
 Chapter XI: POLYDISPERSED GLOBULAR AGGREGATES	 387
1. Partial statistics, cluster term and interference correction term	387
2. Polydispersity and the gamma function	391
3. The component of particle scattering	396
4. Analysis of the particle factors of polydispersed systems	398
5. Analysis of the lattice factor of an amorphous lattice	399
6. Continuous small angle scattering and relative polydispersity	403
 Chapter XII: BUNDLES OF ULTRAFIBROUS PLANE PARALLEL SHEETS	 408
1. Micellar and fibrillar systems	408
2. One-dimensional problem. Expectation value for a fixed number N of particles	410
2.1 General properties of the expression for the intensity function and its relation with the Zernike-Prins theory	413
2.2 Small angle scattering	419
2.3 Integral intensities	421
3. Expectation value for a given shape function	423
4. Laminar factor and ultrafibrillarity	428
5. The intensity function of plane parallel ultrafibrillar polydispersed laminar bundles.	431
6. Babinet component \bar{I}_B of the intensity function	435
7. The degenerate cases	438
8. Two new Lorentz factors.	440
8.1. Bundles with fibrous texture and with lamellae having a large width B_k	441
8.2. Totally disorientated bundles with lamellae having a large width B_k and length L_k	442
 Chapter XIII: CRYSTAL STRUCTURE ANALYSIS WITH THE HELP OF CONVOLUTION INTEGRALS.	 444
1. Bravais lattices and partial Fourier lattices	445
2. The characteristic matrix of the Patterson function and the structure amplitude	448
3. The convolution square root of a sharpened Patterson function of the type of eq. (23)	451
3.1 The general case. Lattice of the type Cu_2AlMn	452
3.2 Lattice of the type NaCl	453
3.3 Lattice of the Al type	455
3.4 Lattice of the type ZnS	456
3.5 Lattice of the diamond type	457
3.6 Lattice of the type CaF_2	458
4. Folding of atoms at the lattice points and partial structure factors	460
5. The superposition effect. Rallying action	463
6. The iterated Gaussian analysis of atom form amplitudes. The number of covalent electrons	466
7. Graphical Gaussian analysis, termination effect and errors of extrapolation	472

8. Correction term and total error.	476
9. Comparison with Hartree's atom model and Debye's temperature factor .	481
10. The real structure of diamond	488
11. The odd Patterson function of Pepinsky. Asymmetric structures and resonance effects at absorption edges (anomalous dispersion)	500
12. Necessity of refinements in practical crystallography	513
Chapter XIV: FINE STRUCTURE OF CRYSTALLINE REFLEXIONS. DIRECT PHASE DETERMINATION	514
1. Separation of the Q_0 -function	514
2. Shift of the reflexions	517
3. Calculation of the gradient of the structure factor	521
4. Shift of reflexions of pseudo-homometric structures	524
5. Direct phase determination by heavy atom technique.	527
Chapter XV: THE PROBLEM OF UNIQUENESS	528
1. Bounded structures and analytical transforms	528
2. Necessary conditions for a unique solution.	529
3. Homometric structures	533
4. Pseudo-homometric structures.	537
5. Babinet's theorem	540
6. Manifold of solutions and precision of experiments	548
Chapter XVI: THE CONVENTIONAL THEORIES OF FLUIDS	553
1. Critical remarks. The primitive liquid	553
2. The interference theory of gases by Debye	559
3. Analysis of the intensity function of the conventional theory	561
4. The interference theory of liquids by Zernike and Prins	567
5. The inverse integral of Warren and Jagodzinski	570
6. Theories of small angle scattering by Debye-Bueche, Fournet and Porod .	576
7. Termination effect.	581
8. The compressibility integral of Ornstein. Critical opalescence	583
Chapter XVII: ANALYSIS OF SMALL ANGLE SCATTERING	587
1. Continuous and discontinuous small angle scattering	587
2. Basic properties of small angle scattering	588
3. Continuous small angle scattering of practically monodispersed systems. .	594
3.1 Globular particles	595
3.2 Non-globular particles	595
4. Continuous small angle scattering of polydispersed systems	598
5. The inner surface in colloidal systems. The surface of a "particle" . . .	600
5.1 Method of Elkin, Shull and Roess.	600
5.2 Method of POROD [1951, 1952]	603
6. Elimination of the errors of collimation	605
7. The methods of analysis of practically continuous small angle scattering .	610
7.1 The $\ln I-u^2$ diagram (GUINIER [1939], WARREN and BISCOE [1942] and HOSEMANN [1951])	611
7.2 The $\ln I-u$ diagram (JOERCHEL [1956])	611
7.3 The $\ln I-\ln(u^2-\sigma^2)$ diagram (SHULL and ROESS [1947])	613
7.4 The $u^2 I-u$ diagram (HOSEMANN [1939], JOERCHEL [1957])	614
7.5 Interference correction and density of packing (JOERCHEL [1957]) . .	617

8. Discontinuous small angle scattering	618
9. Multiple small angle scattering	618
10. Some remarks about secondary extinction	625
Chapter XVIII: EXPERIMENTAL RESULTS	627
1. Analysis of the Fraunhofer diffraction of two-dimensional polydispersed globular aggregates	627
2. Analysis of continuous small angle scattering of X-rays.	632
3. Analysis of discontinuous small angle scattering	645
4. Fraunhofer diffraction of two-dimensional lattices and superlattices . . .	654
5. Analysis of the intensity function of the one-dimensional paracrystal. . .	656
6. Calculation of the degree of crystallinity	664
7. Highly monochromatic X-ray beams	666
8. Real and ideal single crystals.	667
Appendix: SCHWARTZ'S THEORY OF DISTRIBUTIONS AND THE THEORY OF PHYSICALLY OBSERVABLE FUNCTIONS by P. K. GHOSH	674
1. Introduction	674
2. Generalisation of the notion of a function	675
3. Differentiation of distributions	678
4. Pseudo-functions. "Partie finie" of Hadamard	679
5. Multiplication of distributions.	679
6. Division	680
7. Convolution products	680
8. Integration of distributions.	680
9. Fourier series	681
10. Fourier transforms.	681
11. Generalised functions	682
12. Physically observable functions	685
