

CONTENTS

FOREWORD	VII
NOTE ON UNITS AND USAGE	IX
LIST OF SYMBOLS	X
I HISTORICAL INTRODUCTION	1
II PRINCIPLES OF MAGNETIC COOLING	3
1. Basic concept	3
2. Thermodynamic considerations	5
III PARAMAGNETISM	14
I Free ions	14
1. Primary considerations	14
2. Nuclear effects	16
3. Effect of magnetic field	17
3.1. Zeeman effect	17
3.2. Magnetic susceptibility	20
II Real paramagnets – departures from “ideal” behaviour	24
4. The crystal field	24
4.1. General considerations	25
4.2. Matrix elements of the crystal field	27
4.3. The spin Hamiltonian	32
4.4. Rare earth ions	34
5. Paramagnetic resonance	35
6. Interactions	38
6.1. Dipolar interaction	38
6.2. Exchange interaction	45
6.3. Nuclear hyperfine interaction	47
6.4. High temperature approximation derivation of properties from the spin Hamiltonian	48
6.4.1. General	48
6.4.2. Entropy and heat capacity	49
6.4.3. Magnetic susceptibility	52
6.5. Combined effect of interactions and degree of additivity	54
6.6. The effects of dilution	54
7. Demagnetization, or shape, correction	57

8. Ideal susceptibility and the local field	58
8.1. The Lorentz calculation	58
8.2. The Onsager calculation	60
8.3. The Van Vleck calculation	61
8.4. Comparison of local field theories	62
8.5. Critical points	64
IV EXPERIMENTAL PROCEDURE	
1. Cryostats	69
1.1. General	69
1.2. Liquid ^3He interceptor stage	72
1.3. Helium film flow	72
2. Magnets	75
3. Specimen mounting: thermal isolation and thermal contact	78
4. Measurement of susceptibility	85
4.1. Absolute methods	85
4.2. Magnetic induction methods	87
4.2.1. Vibrating magnetometer	87
4.2.2. Mutual inductance bridge	91
5. Measurement of temperature	97
5.1. The magnetic thermometer	97
5.2. Calibration of magnetic thermometers	98
5.2.1. Thermostats	101
5.3. Relation of the magnetic temperature scale to the absolute Kelvin scale	104
5.3.1. Calorimetric method	105
5.3.2. Scaling by physical properties	106
6. Temperature stabilization by isothermal demagnetization	107
V PROPERTIES OF INDIVIDUAL SUBSTANCES	109
1. Cerous magnesium nitrate	109
1.1. Single crystal	109
1.2. Powder	118
2. Chromic alums	119
2.1. Chromic potassium alum	121
2.2. Chromic methylammonium alum	126
3. Ferric ammonium alum	129
4. Neodymium ethylsulphate	133
5. Other salts	138
VI NUCLEAR MAGNETISM	139
1. Nuclear orientation	140
1.1. The orientation process	140
1.1.1. Magnetic hfs polarization	142
1.1.2. Magnetic hfs alinement	144
1.1.3. Electric hfs alinement	144

1.2. Energy levels	146
1.2.1. Case $S = \frac{1}{2}$	146
1.2.2. Case $S > \frac{1}{2}$	148
1.3. Calculation of orientation parameters	148
1.3.1. Eigenvalues and eigenfunctions	148
1.3.2. Nuclear orientation parameters	150
1.3.3. Spin Hamiltonian parameters	153
1.4. Anisotropic emission from oriented radioactive nuclei	154
1.4.1. Gamma-ray anisotropy: theory	155
1.4.2. Application to thermometry	159
2. Nuclear cooling	163
2.1. Limiting temperatures	165
2.2. Cooling power	174
2.3. Thermal contact and isolation at the nuclear stage	176
2.4. Thermometry	180
2.5. Applications of nuclear cooling	182
2.6. Hyperfine-enhanced fields and nuclear cooling	183

APPENDICES

A.1	EFFECTS OF A CRYSTAL FIELD SPLITTING	189
	1. Susceptibility	189
	2. Entropy reduction by a magnetic field	191
	a) Weak field	191
	b) Strong field	192
	c) Brillouin function calculation	192
	d) Exact calculation	195
	e) Comparison	198
A.2	SCHOTTKY-EFFECT ANOMALY IN HEAT CAPACITY	200
A.3	SINGLET STATES AND THE QUENCHING OF ORBITAL ANGULAR MOMENTUM	202
A.4	KRAMERS' THEOREM	204
	1. Effect of magnetic field	207
A.5	GENERATION OF MATRIX ELEMENTS OF ANGULAR MOMENTUM OPERATORS	208
A.6	HIGH TEMPERATURE APPROXIMATIONS USING PRINCIPLE OF INVARIANCE OF DIAGONAL SUM, OR TRACE	210
	1. Traces of some products of angular momentum operators	210
	2. Entropy in magnetic field for $S = \frac{1}{2}$, $I = 0$, anisotropic g -factor	210
	3. Magnetic susceptibility with crystal field or hyperfine interaction	211
A.7	PULSED NUCLEAR MAGNETIC RESONANCE	214
A.8	VAPOUR PRESSURE TABLES FOR ^3He and ^4He	217
	REFERENCES	219
	SUBJECT INDEX	227
