Preface	v
1. Band Theory and Crystal Symmetry	1
1.1. Introduction	1
1.2. Basis of one-electron local potential theory	1
1.2.1. Relation between electron density and local potential	2
1.2.2. Total energy of ground state	4
1.3. Direct and reciprocal lattices	7
1.3.1. Bravais and direct lattices	7
1.3.2. Reciprocal lattice	10
1.3.3. Fourier components of electron density in perfect crystal	10
1.4. Translation operators and Bloch's theorem	12
1.4.1. Existence of energy bands	14
1.5. Rotational invariance and group theory	16
1.5.1. Groups of unitary transformations	16
1.5.2. Unitary transformations leaving Hamiltonian invariant	18
1.5.3. Invariant manifolds and irreducible representations	18
1.5.4. Matrix representation	20
Classes	21
1.5.5. Point group symmetry properties	22
1.5.6. Inversion symmetry of dispersion relation	22
1.5.7. Essential degeneracy: touching of bands	23
Example of character table for point W of face-centred cubic crystal	24
1.6. Surfaces of constant energy; Fermi surface	26
1.6.1. Contact with zone boundary	26
1.7. Density of states	27
1.7.1. Effect of critical points	28
1.7.2. Minimal set of critical points	31
(a) Two-dimensional lattice	31
(b) Three-dimensional lattice	32
1.7.3. Density of states in face-centred cubic lattice	33
1.8. Localized Wannier functions	34
1.8.1. Symmetry of Wannier function	35
1.8.2. Completeness relation	37
1.8.3. Relation to atomic orbitals	38
1.9. Momentum eigenfunction	39

1.9.1. Free electrons	40
1.9.2. Nearly free electron theory	41
1.9.3. Relation to Wannier function	42
1.10. Crystal momentum representation	43
1.10.1. Group velocity	45
1.10.2. Effective mass tensor	46
1.10.3. Effective mass Hamiltonian	47
1.11. Wave function calculations	48
1.11.1. Cellular method	48
(a) Calculation for $\mathbf{k} = 0$	49
(b) Relation to scattering length	51
(c) Band structure in NaCl and CsCl lattices	52
1.11.2. Orthogonalized plane-wave (OPW) method	55
Construction of orthogonalized plane waves	55
1.11.3. Korringa–Kohn–Rostoker (KKR) method	57
(a) Integral equation	58
(b) Secular equation	59
1.11.4. Augmented plane-wave (APW) method	62
1.11.5. Relation between KKR and APW methods	64
(a) Phase-shift analysis	64
(b) Secular determinant of KKR in form of momentum eigenfunction method	67
(c) Relation between effective potential of KKR and APW methods	68
1.11.6. Pseudopotentials	69
(a) Coordinate space representation of matrix elements of KKR method	70
(b) Quantum defect method and model potentials	71
(c) Other forms of pseudopotential	73
1.11.7. $\mathbf{k} \cdot \mathbf{p}$ method	76
1.11.8. Examples of band structure calculations	78
(a) Crystal potential and band structure of copper	78
(b) Treatment of d-bands in transition metals	81
(c) Band structure of Ge and empty lattice treatment	85
(d) Empty lattice band structure for Ge	87
1.11.9. Relativistic band structure calculations	89
(a) Low-energy limit	91
(b) Time-reversal symmetry and spin-orbit coupling	91
(c) Mass–velocity and $\mathcal{E} \cdot \mathbf{p}$ terms	94
(d) Relativistic APW method	95
2. Collective Effects in Solids	100
2.1. Introduction	100
2.2. Classical plasma frequency	101
2.3. \mathbf{k} and ω -dependent dielectric constant of Fermi gas	102

2.3.1. Static dielectric constant $\epsilon(k)$	102
2.3.2. Frequency dependent dielectric constant $\epsilon(\mathbf{k}\omega)$	105
Self-consistent-field dielectric constant	108
2.4. Correlation energy in electron gas	111
2.4.1. Use of SCF dielectric constant	111
2.4.2. Gell-Mann and Brueckner method	111
2.5. Hamiltonian in second-quantized form	112
2.6. Sawada method and plasma dispersion relations	116
2.6.1. Effective Hamiltonian	116
2.6.2. Excited states	118
(a) Example of independent particles	118
(b) Application to Sawada Hamiltonian	118
2.6.3. Plasma dispersion relation	119
2.7. Density matrices and Green functions	121
2.7.1. Definitions and properties of density matrices	121
2.7.2. Natural orbitals	122
2.7.3. Van Hove correlation function	124
2.7.4. Structure factor, dielectric function and energy in uniform electron gas	125
2.7.5. Density matrices and correlation functions in Hartree–Fock theory	126
(a) Fermi hole and pair function of uniform electron gas	128
(b) Free-electron exchange energy	129
2.7.6. Green functions	130
(a) Non-interacting systems	130
(b) Time-dependent perturbations	131
(c) Interacting systems in ground state	132
2.8. Quasi-particles	138
2.8.1. Intuitive discussion	138
2.8.2. Description in terms of Green functions	139
(a) Non-interacting particles	140
(b) Interacting particles	140
2.8.3. Fermi surface	141
2.8.4. Quasi-particle lifetime	143
2.8.5. Operational definition of quasi-particle	145
2.9. Landau Fermi-liquid theory	146
2.9.1. Distribution function and specific heat	147
2.9.2. Particle current	149
2.9.3. Boltzmann equation	150
2.9.4. Use of transport equation in Fermi-liquid theory	152
2.9.5. Landau scattering function in Hartree–Fock theory	153
2.9.6. Some general properties of scattering function	154
Rotational invariance assumption	155
2.10. Diagrammatic techniques and microscopic form of Landau theory	155
2.10.1. Feynman graphs	155

Rules for relating graphs to terms in perturbation series	157
2.10.2. Dyson's equation	158
2.10.3. Self energy	161
(a) Hartree-Fock approximation	161
(b) Random-phase approximation	162
(c) Formal summation of entire series	163
2.10.4. Two-particle Green function and Bethe-Salpeter equation	166
(a) Total spin unity	170
(b) Total spin zero	171
2.10.5. Gell-Mann and Brueckner calculation of ground-state energy	171
2.10.6. Specific heat of high density electron gas	172
2.10.7. Microscopic basis of Landau theory	175
(a) Excited-state Green function	176
(b) Proof that quasi-particles are Fermions	176
(c) Interaction function $f(\mathbf{k}, \mathbf{k}')$	177
(d) Sum rule for Landau parameters	181
2.11. Inhomogeneous electron gas	186
2.11.1. Dielectric function of homogeneous gas including exchange and correlation	186
2.11.2. Functional derivative approach to compressibility	187
2.11.3. Effective field approach to electron gas	189
(a) Equation of motion for one-particle density matrix	189
(b) Random phase approximation	190
(c) Effective field of Singwi and co-workers	190
(d) Hubbard dielectric function	192
(e) Low-density electron gas	193
2.11.4. Response function for inhomogeneous gas	195
Expressions for response function	196
2.11.5. Exchange potential	199
2.11.6. Gradient corrections to slowly varying density formulae	200
(a) Exchange energy	201
(b) Correlation energy	202
2.12. Quasi-particles in insulators	206
2.13. Response function for insulators	210
2.14. Dielectric response function in semi-conductors	212
 3. Lattice Waves	214
3.1. Introduction	214
3.1.1. Plasma description of velocity of sound in metals	215
3.2. Harmonic approximation and dynamical matrix	217
3.3. Acoustic and optical modes	220
3.4. Nature and range of forces	221
3.4.1. Dispersion relation and force range	221

3.4.2. Central forces	222
3.5. Consequences of symmetry	223
3.5.1. Modes of high symmetry in face-centred cubic lattice	224
3.5.2. Face-centred cubic lattice with short range forces	227
3.6. Equilibrium and Cauchy relations	230
3.6.1. Elastic waves in (110) direction	232
3.6.2. Relations between elastic constants	234
3.7. Second quantization and energy spectrum	235
3.7.1. Partition function and thermodynamic properties	236
3.8. Frequency spectra	238
3.8.1. Debye spectrum	238
3.8.2. Moments of frequency spectra	240
3.8.3. Singularities in frequency spectra	242
3.8.4. Spectral distribution per solid angle	243
3.9. Calculation of specific heat	244
3.9.1. Low temperature and Debye θ	245
(a) Expression for Debye temperature in terms of moments	245
(b) Debye temperature evaluated from frequency spectrum	246
3.9.2. Calculation at high temperatures	247
3.10. Electron-ion interaction and phonon frequencies in metals	248
3.10.1. Adiabatic approximation	248
3.10.2. Effect of electron gas on phonon frequencies	250
3.10.3. Second-order energy and dynamical matrix	252
(a) One-body treatment	252
(b) Kohn anomaly	253
(c) Many-body treatment	253
3.10.4. Calculations of phonon spectra	258
(a) Structure	260
(b) Choice of potential and core functions	261
(c) Kohn effect and umklapp processes	262
3.10.5. Cauchy relations and pair forces	264
(a) General inclusion of many-body forces and connection with rigid-ion model	265
(b) Representation in k -space of many-body forces	270
3.11. Lattice dynamics of ionic and covalent crystals	270
3.11.1. Shell model for Ge	271
(a) Lattice dynamics of shell model	272
(b) Dielectric properties and elastic constants	274
(c) Difficulties of shell model applied to ionic crystals	275
(d) Relation to microscopic theory	277
3.11.2. Lyddane-Sachs-Teller relation	279
3.12. Electronic contribution to lattice dynamics in insulators	279
3.12.1. Dynamical matrix	280
3.12.2. Effects due to electrons	281
3.12.3. Acoustic phonons as $q \rightarrow 0$	282

3.12.4. Finite phonon lifetimes due to electron–phonon interactions	285
3.13. Interaction between phonons	286
3.13.1. Inclusion of anharmonicity in Hamiltonian	286
3.13.2. Normal coordinates and creation operators	288
3.13.3. Anharmonic terms in second quantization .	289
3.13.4. Strain Hamiltonian	291
3.13.5. Thermal expansion	293
3.13.6. Self-consistent phonon approximation	296
3.14. One-phonon Green functions	298
3.14.1. Definitions and general properties	298
3.14.2. Results for harmonic crystal	301
3.14.3. Effect of anharmonicity	302
3.14.4. Dyson’s equation and self-energy	302
3.15. Molecular dynamics	305
3.16. Phonon theory of ferroelectrics	308
3.16.1. Dielectric properties	309
3.16.2. Harmonic approximation	310
3.16.3. General linear-response theory	311
3.16.4. Response functions in terms of Green functions	313
3.16.5. Generalization of rigid-ion model	315
3.17. Crystal stability	315
3.17.1. Critical points in electro-static potential	317
3.17.2. Effect of electronic distribution	317
4. Spin and Orbital Magnetism	318
4.1. Introduction	318
4.2. Simplification of Hamiltonian	320
4.2.1. Second quantized form of Hamiltonian	320
4.2.2. Wannier representation	322
4.3. Spin waves and Heisenberg Hamiltonian	324
4.3.1. Form of Hamiltonian	324
4.3.2. Linear chain with ferromagnetic interaction	327
4.3.3. Three-dimensional case	329
4.3.4. Spontaneous magnetization	333
4.3.5. Specific heat	334
4.3.6. Dynamical and kinematic interactions	334
4.4. Antiferromagnetism—spin wave theory	336
4.4.1. Physical picture	336
4.4.2. Ground-state magnetization	337
4.4.3. Variational calculation of ground state	338
4.4.4. Sub-lattice magnetization	339
4.5. Strong correlations in narrow energy bands	341
4.5.1. One-band model with interactions	341
4.5.2. Concepts arising from one-band model	342
4.5.3. Green function and Hubbard Hamiltonian	343

4.5.4. Isolated atom limit	345
4.5.5. Case when hopping is allowed	346
4.5.6. Volume enclosed by Fermi surface	349
4.5.7. Energy of magnetization	350
4.5.8. Criterion for ferromagnetism	352
4.5.9. Mott transition	354
4.5.10. Estimate of exchange splitting	356
4.6. Linear response theory	357
4.6.1. Dynamical susceptibility	357
4.6.2. Relaxation of magnetization	360
4.6.3. Susceptibility in terms of correlation functions	360
4.7. Ground and low-lying excited states for Heisenberg systems	363
4.7.1. Weiss molecular field model	363
(a) Below critical temperature	363
(b) Behaviour near critical temperature T_c	365
4.7.2. Antiferromagnetic ordering	366
4.7.3. Behaviour above critical temperature	368
(a) Curie–Weiss Law	368
(b) Range of correlations near critical temperature	368
4.8. Approach to magnetic critical points	369
4.8.1. Thermodynamic relations between specific heats	370
4.8.2. Classical molecular field theories	371
4.8.3. Scaling laws	372
4.8.4. Equation of state and its parametric representation	373
Use of molecular field theory	374
4.9. High-temperature hydrodynamic limit of response functions	376
4.9.1. Diffusion equation for spin correlation functions	377
4.9.2. Calculation of diffusion constant	378
4.9.3. Limits of validity	384
4.9.4. Critical diffusion	384
4.10. Linear response functions in spin-wave regime	386
4.10.1. Equations of motion	386
4.10.2. Macroscopic treatment of spin waves	386
4.10.3. Static field susceptibility	388
4.10.4. Diffusion in spin-wave region	390
4.11. Frequency and wave-number-dependent susceptibility of non-interacting Bloch electrons	393
4.11.1. Calculation of induced current density	393
4.11.2. Orbital susceptibility	395
(a) Evaluation for free electrons	396
(b) Static orbital susceptibility and Landau diamagnetism	397
4.11.3. Spin susceptibility	398
(a) Evaluation for free electrons	399
(b) Static spin susceptibility and Pauli spin paramagnetism	399

4.11.4. Effect of interactions on spin susceptibility	400
(a) Landau theory of spin susceptibility	400
(b) Gell-Mann–Brueckner theory	401
(c) Interactions at $\mathbf{q} \neq 0$ and spin-density waves	403
4.11.5. Effect of Landau levels on transverse dynamical spin susceptibility of metals	413
Random phase approximation	413
4.12. Spin-density waves and itinerant antiferromagnetism in chromium	417
(a) Band structure and Fermi surface in chromium	418
(b) Fedders–Martin criterion for antiferromagnetism	419
4.13. Paramagnons in nearly ferromagnetic systems	427
4.14. Ruderman–Kittel–Yosida interaction and magnetism in rare-earth metals	429
(a) Rare-earth metals and indirect exchange	432
(b) Corrections to Ruderman–Kittel formula	436
4.15. De Haas–van Alphen effect	438
4.15.1. Diamagnetism of free electrons	438
(a) Quantum-mechanical theory from Bloch density matrix	439
(b) Free energy	441
4.15.2. Onsager result for Bloch electrons	443
(a) Free electrons	443
(b) Bloch electrons	445
4.15.3. Spherical nature of Fermi surfaces in alkali metals	450
5. Interaction of Particles with a Crystal	451
5.1. Introduction	451
5.2. Differential cross-section in Born approximation	451
5.3. Scattering of neutrons by nuclei	455
5.3.1. Elastic scattering and Debye–Waller factor	456
Debye model	458
5.3.2. General formulation for total scattering	459
Inelastic scattering	461
5.3.3. Experimental spectrum in terms of pair potentials	463
Dispersion curves for phonons in Al	464
5.4. X-ray scattering by electrons	466
5.4.1. Interaction of photons with electrons	467
5.4.2. Scattering by all electrons of perfect lattice	468
(a) Relative magnitudes of elastic and inelastic terms	470
(b) Effect of temperature	470
5.4.3. Scattering by outer electrons	471
(a) Crystalline field splitting	471
(b) Method of local distributions	473
5.5. Compton profile in X-ray scattering	478
5.5.1. Independent-electron approximation	479
5.5.2. Influence of correlations	482

5.5.3. Effect of binding energy	483
5.6. Scattering of electrons by electrons	485
5.6.1. Positron annihilation	485
Angular correlation of photons	486
5.6.2. Fast electron energy losses and plasma excitation	488
5.7. Scattering of neutrons by electrons	490
5.7.1. Magnetic Hamiltonian and matrix elements	490
5.7.2. Total scattering	492
5.7.3. Elastic scattering	493
5.7.4. Scattering from spin assemblies	493
(a) Measurement of magnon spectrum	493
(b) Spin-wave scattering cross-section	496
(c) Spin diffusion at high temperatures	498
(d) Critical scattering	499
5.7.5. Orbital motion and neutron scattering	500
Plane-wave case	502
5.7.6. Comparison of spin susceptibility with measured $S(\kappa, \omega)$ for nickel	505
5.7.7. Neutron scattering by ferroelectrics	507
(a) Relation between dielectric susceptibility and structure factor	507
(b) Harmonic approximation	508
(c) Influence of anharmonicity	509
(d) Relation of $\chi(\kappa, \omega)$ to dielectric function	509
(e) Comparison with experiment	512
Appendices	516
A1.1. Hartree–Fock equations and Koopman’s theorem	517
A1.2. Density–potential relation and associated variational principle in one-body theory	522
A1.3. Space groups	526
A1.4. Feynman’s theorem	531
A1.5. Group velocity formula	532
A1.6. Topological basis of Morse relations	534
A1.7. Korringa–Kohn–Rostoker method	541
A1.8. Relativistic APW method	546
A2.1. Equivalence of high-density procedures for electron gas	550
A2.2. Perturbation theory and diagrammatic techniques for ground state of electron gas	555
A2.3. Ward identities	581
A2.4. Gradient expansion of energy densities	590
A2.5. Correlation energy of non-uniform electron gas	594
A2.6. Dielectric function of semi-conductor	598
A3.1. Elastic constants and wave equations in continuum model	604
A3.2. Crystals with more than one atom per unit cell	609
A3.3. Adiabatic approximation	611

A3.4. Lattice dynamics of shell model: treatment of Coulomb coefficients	613
A3.5. Proof of Lyddane-Sachs-Teller relation	615
A3.6. Statistical density matrix	618
A3.7. Diagrammatic techniques for interactions involving phonons	621
A4.1. Ground state of linear antiferromagnetic chain	629
A4.2. Detailed balancing	637
A4.3. Relation between permeability and dielectric functions of a uniform electron gas	637
A5.1. Inelastic scattering of neutrons by anharmonic crystals	640
Problems	646
References	659
Index	669
