

Contents

1. CRYSTAL STRUCTURE	1
Miller indices. Simple crystal structures. Hexagonal close-packed structure (hcp). Diamond structure. Zinc blende structure. Sodium chloride structure. Cesium chloride structure. Calcium fluoride (fluorite) structure. Collections of crystal structure data. Empirical classification of crystal binding. Ionic crystals. Covalent crystals. Metal crystals. Molecular crystals. Hydrogen-bonded crystals. Ionic radii.	
2. DIFFRACTION OF WAVES BY CRYSTALS	29
Bragg's law. Laue diffraction equations. Interference conditions and the reciprocal lattice. Atomic scattering factor. Geometrical structure factor. Experimental x-ray diffraction methods. Laue method. Rotating-crystal method. Powder method.	
3. THERMAL PROPERTIES OF SOLIDS	45
Harmonic oscillator model—classical mechanics. Einstein model of the lattice heat capacity. Debye model of the lattice heat capacity. Heat capacity of conduction electrons in metals. Phonons. Thermal conductivity of solids. Thermal expansion.	
4. DIELECTRIC PROPERTIES	69
Local electric field. Depolarization field. Lorentz field. Field of dipoles inside cavity. Field in dielectric between condenser plates. Dielectric constant and polarizability. Measurement of dielectric constants. Electronic polarizabilities. Classical theory of electronic polarizability. Ionic polarizabilities. Orientational polarizabilities. Dipole orientation in solids. Dipole relaxation and dielectric losses. Debye relaxation time. Relaxation in solids. Complex dielectric constants and the loss angle. Ferroelectric	

crystals. Electrets. Classification of ferroelectric crystals. Theory of barium titanate. The polarization catastrophe in ferroelectrics. Local field in the perovskite structure. Ferroelectric domains.

5. FREE ELECTRON MODEL OF METALS 106

Electrical conductivity and Ohm's law. Wiedemann-Franz ratio. Heat capacity of conduction electrons. Paramagnetic susceptibility of conduction electrons. Quantum theory of free particles in a box. Fermi-Dirac distribution law. Absolute zero. Quantum theory of the heat capacity of the electron gas. Quantum theory of spin paramagnetism. Effect of Fermi-Dirac distribution on the electrical conductivity. Plasma frequency. Transparency of alkali metals in the ultraviolet. Thermionic emission equation.

6. BAND THEORY OF SOLIDS: BRILLOUIN ZONES 143

Brillouin zone in one dimension. Wave functions in a periodic lattice. Wave functions for zero wave vector. Effective mass of electrons in crystals. Physical basis of effective masses. Holes: positive charge carriers. Motion of holes. Hall effect. Electrical conductivity of metals. Residual resistance. Brillouin zones. Face-centered cubic lattice. Hexagonal close-packed structure. Band structure of metals. Alkali metals. Noble metals. Divalent metals. Trivalent metals. Binary alloys. Hume-Rothery rules for alloy phases. Transition elements. Order-disorder transformation.

7. SEMICONDUCTORS: PHYSICS AND DEVICES 199

Intrinsic conductivity. Mobility in the intrinsic region. Impurity or extrinsic conductivity. Impurity states. Thermal ionization of impurities. Mobility in the presence of impurity atoms. Analysis of experimental results. Lifetime and recombination. Minority carrier transport and hole injection. Cyclotron resonance experiments. Radiation damage in semiconductors. Barrier rectification. p - n junction rectification. Tunnel diodes. Point contact transistors. Junction transistors.

8. MAGNETISM AND MAGNETIC RESONANCE 251

Diamagnetism. Derivation of the Langevin diamagnetism equation. Paramagnetism. Langevin theory of paramagnetism. Cooling by adiabatic demagnetization of a paramagnetic salt. Magnetic resonance. Ferromagnetic resonance absorption. Ferromagnetism. Temperature dependence of the spontaneous mag-

netization. Spontaneous magnetization at absolute zero. Ferromagnetic domains. Origin of domains. Coercive force and hysteresis. Reversible permeability. Anisotropy energy. Magnetostriction. The Bloch wall. Domain dimensions. Antiferromagnetism. Two-sublattice model. Antiferromagnetic resonance. Determination of spin lattices by neutron diffraction. Ferrites. Spin waves.

9. DISLOCATIONS: STRENGTH OF SOLIDS 305

Shear strength of single crystals. Dislocations. Stress fields of edge dislocations. Low-angle grain boundaries. Dislocation densities. Dislocation multiplication and slip. Strength of alloys. Dislocations and crystal growth.

APPENDIX

A. Perturbation of nearly free electrons by a periodic potential. Three dimensions. B. Tight binding approximation for metallic electrons. C. Important conversion factors. D. Values of general physical constants.
