Volume I

PREFACE	vii
INTRODUCTION	1
PART I. FLUCTUATING FIELDS AND RANDOM CHAINS	
Chapter 1. Statistical Physics	7
1.1. Classical statistics	7
1.2. Classical fields	10
1.3. Free fields	12
1.4. Field correlation functions	18
1.5. Wick's theorem	23
1.6. Quantum statistics	25
Chapter 2. Perturbation Theory	31
2.1. General formalism	31
2.2. Vacuum contribution $Z[0]$	34
2.3. Two-point function and self-energy graphs	39
2.4. Four-point and vertex functions	42
2.5. Special features of local theories	45
2.6. Momentum space diagrams	47
2.7. Relation between vacuum diagrams and correlation functions	53

Chapter 3. Gauge Invariant Field Theories	55
3.1. Free magnetic fields	55
3.2. Gauge-fixing factors	62
3.3. Charged scalar fields	66
3.4. Feynman diagrams	68
3.5. Non-Abelian gauge theories	72
3.6. Non-Abelian field theories involving the space group	83
Chapter 4. Low Temperature Expansion Around Extrema	92
4.1. Extremal field configurations	92
4.2. Saddle-point approximation of integrals	95
4.3. Saddle-point approximation for fluctuating fields	97
4.4. Connected correlation functions	101
4.5. Symmetry properties of extremal field configurations: currents and conservation laws	105
Appendix 4A. Vacuum diagrams	110
Chapter 5. Effective Energy	114
5.1. Extremal principle	114
5.2. Tree graphs and vertex functions	116
5.3. Graphical content of the effective energy	120
5.4. The one-particle irreducibility of $\Gamma[0]$	124
5.5. Proper self-energy	128
Appendix 5A. Graphs contributing to $(1/T) W[j]$	130
Chapter 6. Feynman Diagrams and Random Walks	133
6.1. General remarks	133
6.2. Single random walk	136
6.3. Material random chains in thermal equilibrium	145
6.4. Grand canonical ensemble of closed oriented random chains and disorder fields	149
6.5. Critical region	151
6.6. Closed random chains and loop diagrams	153
6.7. Open random chains and lines in Feynman diagrams	154
6.8. Field fluctuations versus line fluctuations	156
6.9. Ensembles of fluctuating lines in the critical region	162
6.10. General properties of lattice Green functions	164
6.11. Calculation of lattice Green functions via the hopping expansion	167
6.12. Improving the convergence of hopping expansion	180
6.13. Exact one- and two-dimensional Coulomb Green function on a square lattice	193
6.14. Fluctuation determinants	204
6.15. Finite-size effects on the fluctuation determinant and quantum statistics of a free field	212
6.16. Short-range steric interactions between chains versus field interactions	220
6.17. Incorporating long-range forces	226
6.18. Interacting random chains and Feynman diagrams	231

Appendix 6A. Green functions and fluctuation determinants for non-cubic lattices	232
PART II. GAUGE FIELDS IN SUPERFLUID HELIUM	
Chapter 1. Superfluidity	255
1.1. Basic properties	255
1.2. Field description of superfluid phase transition	258
1.3. Nambu-Goldstone modes and superfluid velocity	266
1.4. Straight vortex line	267
1.5. Vortex lines of arbitrary shape, vortex density	275
1.6. Branching vortex lines	280
1.7. Hydrodynamic energy of vortex lines	282
1.8. Vector potential versus phase angle	290
Chapter 2. Grand Canonical Ensembles Of Interacting Vortex Lines	300
2.1. Disorder fields for vortex lines	300
2.2. Thermodynamic quantities	302
2.3. Nambu-Goldstone modes of the disorder field	304
2.4. Inclusion of hydrodynamic forces	304
Chapter 3. Ginzburg-Landau Theory of Superconductivity	307
3.1. London equations	307
3.2. Order parameter	309
3.3. Order field	310
3.4. Ginzburg-Landau energy	312
3.5. Gorkov's derivation	313
3.6. Ginzburg-Landau equations	316
3.7. Critical magnetic field	319
3.8. The two length scales and type I versus type II superconductivity	320
3.9. Single vortex line and critical field H_{c_1}	324
3.10. The field H_{c_2} when superconductivity is destroyed	330
3.11. Fluctuation corrections	332
3.12. Phase transition in disorder field theory and disorder version of the Meissner effect	341
Chapter 4. Lattice Model of the Superfluid Phase Transition	346
4.1. Motivation	346
4.2. The XY model	348
4.3. High temperature expansion	352
4.4. Physical interpretation	392
4.5. Estimate of critical properties via the ratio test	393
Appendix 4A. Graphs of order β^{10}	401
Chapter 5. Mean Field Methods for Lattice Models	409
5.1. Variational estimates of thermodynamic properties	409
5.2. Equivalent field formulation of the XY model	417
5.3. Fluctuation modes	423
5.4. One-loop correction to the mean-field energy	430

5.5. Local formulation with two complex fields	436
5.6. Correlation functions of the XY model	440
5.7. Improvement of the mean-field-plus-one-loop approximation	442
5.8. Effective energy approach	449
Appendix 5A. Generalization to classical $O(n)$ spin models	462
Chapter 6. Vortex Lines in the XY Model	466
6.1. Integer-valued gauge fields	466
6.2. Vortex lines	474
6.3. Formal low temperature limit of the vortex-line representation	480
6.4. Improved treatment of the low temperature limit	485
Chapter 7. The Villain Approximation and the Villain Model	489
7.1. The Villain approximation	489
7.2. The Villain model	498
7.3. High and low temperature expansions of the Villain model	499
7.4. Monte Carlo simulation of the Villain model	518
7.5. Comparison of the XY model with its Villain approximation	520
7.6. The XY model versus Villain model of superfluidity	535
7.7. Perturbation expansions of the XY model ($1/\beta$ -expansion)	537
7.8. Hartree-Fock resummation	540
7.9. Comparison with the mean-field-plus-loop approach	544
7.10. Vortex corrections	546
Appendix 7A. The low temperature expansion of the Villain approximation	550
Chapter 8. Gauge Fields of Vortex Lines	553
8.1. Vortex-gauge field and vortex-gauge invariance	553
8.2. Physical meaning of vortex-gauge invariance	554
8.3. Continuum description	557
8.4. Vortex gauge theory for the Villain model – double gauge theory	559
8.5. Derivation of energy of vortex lines from vortex-gauge fields	563
8.6. Continuum limit	565
Chapter 9. Correlation Functions	568
9.1. Path-integral representation	568
9.2. Monopole gauge field – triple gauge theory	570
9.3. Other representations of correlation functions in the Villain model	573
9.4. High temperature expansion for the two-point correlation function and susceptibility	578
9.5. Ratio test for the susceptibility expansion	590
9.6. Isotropy of high temperature correlation functions at large distances	591
9.7. Low temperature expansion of the correlation function in the Villain model	595
Chapter 10. Gas of Monopoles	598
10.1. Z_n Villain model	599
10.2. Villain model in a generalized external magnetic field	601
10.3. Relation to lattice gauge theory	602
10.4. Z_n cosine models	608

10.5. High temperature series of Z_n models	612
10.6. Z_2 (Ising) model, Z_3 (three-state Potts) model, Z_4 (Ashkin-Teller) model	612
Chapter 11. Two-Dimensional Considerations	618
11.1. Films of superfluid helium	618
11.2. High temperature expansion of $D = 2$ XY model	619
11.3. Vortex representation in two dimensions	620
11.4. Low temperature expansion of the Villain model	629
11.5. Determination of the transition point	639
11.6. Villain approximation for $D = 2$	641
11.7. Vortex corrections in $D = 2$ XY model	643
11.8. Correlation functions in the 2-dimensional Villain model	653
11.9. Explicit calculation of the two-point correlation function at low temperatures	658
11.10. The renormalization group	663
11.11. Coherence length	669
11.12. Universality of the critical stiffness	672
11.13. Exact formula for the renormalization of superfluid density by vortices	675
11.14. Equivalence of the Villain model to the limiting case of the sine-Gordon model	679
11.15. Estimate of the critical temperature in the sine-Gordon model	681
11.16. Self-consistent approximation to the coherence length of the XY and sine-Gordon models	685
11.17. Surface roughening and crystal growth	688
Chapter 12. Lattice Derivation of Disorder Field Theory	694
12.1. Equivalence of the XY model to a lattice superconductor	694
12.2. From lattice superconductor to Ginzburg-Landau theory	697
12.3. Comparison with approximate disorder theory	701
12.4. Natural core energies	703
12.5. Type-I or type-II disorder theory	707
12.6. Quantum vortex dynamics in films of superfluid helium	709
Chapter 13. Vortex Lines in the Ginzburg-Landau Theory and Their Disorder Field Theory	716
13.1. General discussion	716
13.2. Vortex-line representation of a general lattice superconductor	717
13.3. Disorder field theory of vortex lines in lattice superconductors	717
13.4. Limiting cases	726
13.5. Phase transitions in lattice superconductors	729
13.6. Tricritical point in a superconductor	736
