CONTENTS

Preface v

1 Outline 1

2 Plasmons and excitons 4
2.1 Plasma frequency 4
2.2 Screened interaction between electrons in a metal 6
2.3 Single-particle and collective excitations 7
2.4 Experimental observations of plasmons 10
2.4.1 Frequency-dependent dielectric function $\epsilon(\omega)$ 10
2.4.2 Energy losses of fast electrons 12
2.4.3 Experimental demonstration of anisotropy of plasmon dispersion 13
2.5 Non-degenerate plasma: Debye length 15
2.6 Surface plasmons; inhomogeneous electron gas 16
2.6.1 Classical treatment for long wavelength 17
2.6.2 Model of dielectric function $\epsilon(\omega)$ in terms of bulk plasmon 18
2.6.3 Comparison with experiment 18
2.6.4 Form of charge density in surface plasmon mode 19
2.6.5 Relation to surface energy of metals 19
2.6.6 Dispersion of surface plasmon 20
2.7 Density oscillations round a test charge in a bulk metal and at metal surfaces 21
2.8 Frenkel excitons in insulating crystals 22
2.8.1 Dipole–dipole interaction and energy of Frenkel excitons 23
2.8.2 Effective mass and energy transport properties 26
2.9 Wannier excitons 28
2.9.1 Effective mass equation for large-radius exciton 29
2.9.2 Optical absorption as modified by electron–hole interaction 31
2.9.3 Intermediately bound excitons 35
2.9.4 Indirect excitons 35
2.10 Low-density regime: molecular state 36

2.11 High-density regime: electron–hole liquid 37
2.11.1 Hamiltonian for an electron–hole liquid 37
2.12 Coupling between plasmons and excitons 40
2.13 Excitons in metals 40

3 Phonons in solids 46
3.1 Debye model 47
3.2 Dispersion of lattice waves 48
3.3 Optical phonons 50
3.4 Dynamical matrix: three-dimensional case 52
3.4.1 Polarisation of modes 54
3.5 Thermodynamic properties 55
3.5.1 Phonon density of states 56
3.6 Phonon dispersion curves from scattering experiments 59
3.6.1 Interplanar force constants in metals 60
3.6.2 Phonon dispersion curves for KBr 63
3.7 Optical absorption due to lattice vibrations 65
3.8 Anharmonicity and phonon lifetimes 68
3.9 Effect of disorder on atomic dynamics 71

4 Polarons and the electron–phonon interaction 76
4.1 Energy of small polaron 78
4.2 Energy of large polaron 79
4.3 Coupling constant between optical modes and electron 79
4.4 Mobility of small polaron 80
4.5 Dielectric function of ionic crystals 83
4.6 Electronic dipoles and models of phonons beyond rigid ions 85
4.6.1 Dielectric function in periodic crystal 86
4.7 Polaritons in ionic crystals 87
4.8 Electron–phonon interaction and Kohn anomalies 89
4.8.1 Peierls distortion 90
4.9 Bohm–Staver formula for velocity of sound in metals 92
4.9.1 Interactions between planes of ions in metallic sodium 93

5 Superconductivity 96
5.1 Electronic specific heat 96
5.2 Critical magnetic field and free energies 97
5.3 Isotope effect 98
5.4 Electron–electron interaction via ionic lattice 99
5.5 Cooper pairs 100
5.5.1 Size of Cooper pair 102

5.6 Bardeen, Cooper and Schrieffer (BCS) model 103
5.7 Ginzburg–Landau theory and London equation 105
5.8 Meissner effect 106
5.9 Type-II superconductors: characteristic lengths 107
5.10 Josephson junction 109
5.10.1 Junction with voltage across it 110

6 Magnons 113
6.1 Dispersion relation for ferromagnetic spin waves 113
6.2 Spin–spin interaction Hamiltonian 113
6.3 Heisenberg Hamiltonian 114
6.4 Measurement of magnon spectrum 116
6.5 Spontaneous magnetisation 118
6.6 Low-temperature specific heat 119
6.7 Magnetisation–internal energy relation 119
6.7.1 Magnetic insulators 120
6.7.2 Metallic ferromagnets 120
6.8 Antiferromagnetism 120
6.9 Hamiltonian and dispersion relation for two-sublattice model of an antiferromagnet 121
6.10 Spin waves in disordered magnets 123
6.11 Indirect exchange between localised spins in a metal 124
6.12 Kondo effect 126

7 Collective effects in liquids 130
7.1 Neutron scattering and liquid structure 130
7.1.1 Atomic scattering factor for the case of x-rays 131
7.2 Inelastic neutron scattering and collective modes 134
7.3 Primitive model for dispersion relation 134
7.4 Collective coordinates and thermal properties of liquid metals 136
7.5 Hydrodynamics and collective modes in classical liquids 138
7.6 Optical modes in ionic liquids 141
7.7 Quantum liquids 143
7.8 Liquid ^{4}He 144
7.8.1 Condensation in a Bose–Einstein gas 144
7.8.2 Properties of liquid ^{4}He 146
7.8.3 Structure and excitations 147
7.8.4 Landau's explanation of superfluidity 151
7.8.5 Elementary excitations in very thin superfluid ^{4}He films 152

7.9 Liquid ^{3}He 152
7.9.1 Angular momentum state of Cooper pairs 154
7.9.2 Spin wave propagation in superfluid ^{3}He 156
7.10 Structure factor and radial distribution function of an electron liquid 157

8 Phase transitions 161
8.1 Weiss molecular field theory of ferromagnetism 161
8.1.1 Paramagnetic behaviour 161
8.1.2 Ferromagnetic ordering 163
8.1.3 Molecular field theory and critical exponents 164
8.2 Weiss field form of two-sublattice model of an antiferromagnet 165
8.3 Liquid–gas critical point 167
8.3.1 Fluid described by the van der Waals equation of state 168
8.3.2 Structure of fluid near the critical point 170
8.4 Scaling laws 170
8.4.1 Identification of parameters with critical indices 171
8.4.2 Equation of state and its parametric representation 172
8.4.3 Use of molecular field theory 173
8.5 Phase diagrams and elementary excitations 173
8.6 Phase transition in one-component classical plasma 176
8.6.1 Application to melting of metallic Na 177
8.7 Dislocation model of melting in a two-dimensional assembly of interacting electrons 179
8.8 Metal–insulator phase transitions 180
8.8.1 Order parameter for metal–insulator transitions at $T = 0$ 181
8.8.2 Second-order transition for strong electron–electron correlations in a half-filled narrow energy band 183
8.8.3 Spin susceptibility near the metal–insulator transition 184
8.9 Structural phase transitions 185
8.9.1 Precise form of order parameter 186
8.9.2 Soft phonon modes 187
8.9.3 Microscopic theory 188
8.10 Electron–phonon interaction and phase transitions 189
8.11 Structural phase transition of A15 compounds 190
8.12 Structural phase transition of a quasi-one-dimensional conductor 192
8.13 Solitons as quasi-particles in non-linear treatments 194
8.13.1 Example of sine–Gordon equation 195
8.14 Dynamics in critical phenomena 196
8.14.1 Universality 197

Appendixes **202**

2.1 Screening and dielectric function of a degenerate uniform electron gas 202
2.2 Hydrodynamic model of bulk and surface plasma modes 205
2.3 Energy loss of fast electrons by plasmon excitation 210
3.1 Waves in an elastic continuum 212
3.2 Phonons in a face-centred cubic lattice with central, short-range forces 217
3.3 Neutron scattering and Debye–Waller factor 220
3.4 Coulomb terms and phonon dispersion in the rigid-ion model of ionic crystals 225
3.5 Two-phonon processes in semiconductors 229
3.6 Effect of disorder on atomic dynamics of a linear chain 230
4.1 Polaron Hamiltonian in continuum model 231
5.1 Flux quantisation in a superconductor 233
5.2 Phenomenological treatment of Ginzburg–Landau equations 235
6.1 Bounds on the energy of the antiferromagnetic ground state 238
6.2 Antiferromagnetic linear chain 240
6.3 Spin waves in the one-dimensional antiferromagnet $CsCoCl_3$ 241
7.1 Electrical conductivity and Van Hove function $S(K, \omega)$ 243
7.2 Relation between superfluidity and superconductivity 245
8.1 One-dimensional metal in the presence of a strong electron–phonon interaction 249
8.2 Model of phase transition in Nb_3Sn, and particularly elastic properties 251
8.3 Ornstein–Zernike theory of liquid–gas critical point and brief reference to renormalisation methods 255

Notes added in proof **257**
