

Table of Contents

1. Introduction	1
2. Computer Methods in the Study of Phase Transitions and Critical Phenomena	3
2.1 Statistical Mechanics and Phase Transitions	5
2.1.1 Modern theories of phase transitions and critical phenomena	5
2.1.2 Statistical mechanics, order parameters, fluctuations, critical exponents, scaling, and universality	6
2.2 Numerical Simulation Techniques	9
2.2.1 Monte Carlo methods	9
2.2.2 A Monte Carlo importance-sampling method	10
2.2.3 A realization of a Monte Carlo method	13
2.2.4 General limitations of the Monte Carlo method	15
2.2.5 Broken ergodicity	15
2.2.6 Distribution functions	18
2.2.7 Coarse-graining techniques and criteria of convergence	19
2.2.8 Finite-size effects	20
2.2.9 Determining the nature of a phase transition	22
2.2.10 Computational details	27
2.2.11 General advantages of the Monte Carlo method: Applications	28
2.3 Exact Configurational Counting and Series Expansions	29
2.3.1 A general approach	29
2.3.2 The moment method	31
2.3.3 Principles of the calculation	32
2.3.4 Step 1. Determination of all distinct graphs and their multiplicities	33
2.3.5 Step 2. Embedding of connected graphs into a lattice	35
2.3.6 General correlation function series	36
2.3.7 Capabilities and limitations of a general approach	37
3. Monte Carlo Pure-model Calculations	39
3.1 Critical Behavior of the Three-dimensional Ising Model	40
3.1.1 The Ising model and its order parameter	40

3.1.2	Numerical evidence of a phase transition in the Ising model on a diamond lattice	41
3.1.3	Finite-size scaling analysis and critical behavior	43
3.1.4	Are Monte Carlo techniques practicable in the study of critical phenomena?	47
3.2	Phase Behavior of Ising Models with Multi-spin Interactions	48
3.2.1	Higher-order exchange in magnetic systems	48
3.2.2	Ising models with multi-spin interactions	48
3.2.3	First-order phase transitions of Ising models with pure multi-spin interactions	49
3.2.4	Universality and tricritical behavior of Ising models with two- and four-spin interactions: Pair interactions as a symmetry-breaking field	57
3.3	Thermodynamics of One-dimensional Heisenberg Models	67
3.3.1	One-dimensional magnetic models	67
3.3.2	The anisotropic Heisenberg model in a magnetic field	69
3.3.3	Comparison with theoretical calculations on a continuum model	72
3.3.4	A model of the linear magnet CsNiF_3 ?	74
4.	Testing Modern Theories of Critical Phenomena	77
4.1	Fluctuation-induced First-order Phase Transitions	78
4.1.1	The role of fixed points in the renormalization group theory	78
4.1.2	Motivation for computer studies of fluctuation-induced first-order phase transitions	79
4.1.3	Phase transitions in antiferromagnets with order parameters of dimension $n=6$ and $n=3$	80
4.1.4	Crossover from first-order to continuous transitions in a symmetry-breaking field	85
4.1.5	Fluctuation-induced first-order phase transitions in Ising models with competing interactions	90
4.2	Critical Phenomena at Marginal Dimensionality	93
4.2.1	The role of a marginal spatial dimension	93
4.2.2	Computer experiments of hypercubic Ising models: »A romance of many dimensions«	95
4.2.3	Susceptibility and critical isotherm of the four-dimensional Ising model	99
4.2.4	Conclusions on critical behavior in marginal dimensions	100
4.3	Basic Assumptions of Critical Correlation Theories	101
4.3.1	Review of a critical correlation theory	101
4.3.2	Testing the basic assumption by Monte Carlo calculations	103

5. Numerical Experiments	107
5.1 Phase Transitions in Lipid Bilayers and Biological Membranes	108
5.1.1 What are biological membranes and what do they do? .	108
5.1.2 Lipid bilayers are model membranes	109
5.1.3 Phase behavior of lipid bilayers	110
5.1.4 Back to biology: Are phase transitions at all relevant to the biological functions of the membrane?	110
5.1.5 Theories of lipid bilayer phase transitions	111
5.1.6 Computer simulations of lipid bilayers	112
5.1.7 Multi-state models of lipid bilayers	113
5.1.8 Computer simulations of the q -state models for the gel-fluid phase transition	116
5.1.9 Computer simulation of the phase behavior of lipid bilayers with »impurities«: cholesterol, proteins, and polypeptides	124
5.1.10 Have computer studies provided any new insight into the properties of biological membranes?	127
5.2 Nuclear Dipolar Magnetic Ordering and Phase Transitions . .	128
5.2.1 Nuclear dipolar magnetic ordering	128
5.2.2 The secular dipolar Hamiltonian	129
5.2.3 Perspectives in studies of nuclear dipolar magnetic ordering	130
5.2.4 Motivation for a numerical simulation study of nuclear dipolar magnetic ordering	131
5.2.5 Monte Carlo studies of systems with truncated classical secular dipolar interactions	132
5.2.6 Nature of the spin structures: »Permanent« structures or the devil's staircase?	133
5.2.7 Double-layered spin structures in CaF_2 -like systems: Continuous transitions and critical behavior	138
5.2.8 Multi-layered spin structures in CaF_2 -like systems: Firstorder phase transitions	144
5.2.9 Can series expansions provide information on the nature of the phase transitions?	145
5.2.10 Nuclear antiferrimagnetic susceptibilities of systems with two spin species: LiF and LiH	146
5.3 Phase Transitions of Adsorbed Monolayers	148
5.3.1 Two-dimensional phases of molecules adsorbed on solid surfaces	148
5.3.2 N_2 physisorbed on graphite: The anisotropic-planar rotor model	149
5.3.3 The Heisenberg model with cubic anisotropy	152
5.3.4 Fluctuation-induced first-order phase transition in the anisotropic-planar rotor model	153

5.3.5	Comparison with experiments on N_2 physisorbed on graphite	160
5.3.6	Phase behavior on the anisotropic-planar rotor model with vacancies	162
5.3.7	Physical realizations of the anisotropic-planar rotor model with vacancies	170
5.4	Kinetics of Growth	170
5.4.1	Growth	170
5.4.2	Computer simulation of domain-growth kinetics	172
5.4.3	Domain-growth kinetics of herringbone phases	173
5.4.4	Domain-growth kinetics of pinwheel phases	181
5.4.5	Kinetics of growth and critical phenomena	182
	Bibliography	185
	Subject Index	197
