

INDICE

G. CAGLIOTTI - Introduction to the Course.	pag.	xv
Gruppo fotografico dei partecipanti al Corso	fuori testo	
A. N. GOLAND - Recent studies of point defects in metals. Selected topics.		
1. Introduction	pag.	1
2. Statistical thermodynamics of defects in equilibrium concentration	»	5
2'1. Formation and binding entropies and enthalpies	»	5
2'2. Inclusion of impurities	»	8
3. Determination of defect parameters and configurations	»	9
3'1. Concentrations	»	9
3'1.1. Equilibrium concentrations	»	9
3'1.2. Nonequilibrium concentrations	»	13
3'2. Formation and binding energies	»	18
3'2.1. Thermodynamics	»	18
3'2.2. Positron annihilation applied to vacancy studies	»	22
3'3. Annealing kinetics and rate theory	»	43
3'3.1. Introduction	»	43
3'3.2. Annealing of nonequilibrium concentrations of defects	»	44
3'3.3. Analysis of annealing curves	»	48
3'3.4. The general chemical-rate equation	»	52
3'3.5. Difficulties in the interpretation of reaction kinetics	»	52
3'4. Defect sites and configurations	»	55
3'4.1. X-ray and neutron scattering methods	»	56
3'4.2. Channeling. Foreign-atom location.	»	64
3'4.3. Lattice models of defects	»	69
4. Point defects and elastic-property changes	»	74
4'1. Dislocation damping and pinning	»	75
4'2. Bulk effect	»	77
4'3. Point-defect relaxation	»	77

5. Point-defect models from radiation research and technology pag.	88
5'1. Radiation damage	» 88
5'2. Helium in metals	» 97
5'3. Void nucleation and growth in metals	» 110

N. H. MARCH – Electron theory of vacancy formation energies
in terms of surface energies of metals.

1. Introduction	» 120
2. Relation between vacancy formation energy and surface energies for simple metals	» 121
2'1. Jellium model	» 123
3. Relation between E_v and σ for transition metals	» 124
4. Displaced charge round vacancy and « thickness » of electron distribution at a metal surface.	» 126
5. Preliminary discussion of effects of lattice	» 127
6. Electrostatic model of interaction between charged defects	» 129
7.	» 129
Appendix	» 130

P. B. HIRSCH – Dislocations and mechanical properties of
metals.

1. General properties	» 133
1'1. Introduction	» 133
1'2. The Burgers vector.	» 135
1'3. Dislocation glide and climb	» 136
2. Elasticity theory	» 137
2'1. General	» 137
2'2. Screw and edge dislocation	» 138
2'3. Image forces.	» 141
2'4. Force on a dislocation	» 143
2'5. Interactions between straight dislocations.	» 143
2'6. Dislocation arrays	» 145
2'7. General dislocation loop	» 147
2'8. Self-stress and line tensions	» 148
2'9. Effects of crystal anisotropy	» 151
3. Dislocations in crystal lattices	» 153
3'1. Dislocation dissociation	» 153
3'2. Slip systems	» 159
3'3. Lattice friction stress.	» 160

4. Applications to mechanical properties	pag. 163
4'1. Yield stress in alloys	» 163
4'2. Flow stress in a work-hardened metal	» 167
4'3. Thermally activated processes	» 169
4'4. Work-hardening in dispersion-hardened alloys	» 170
4'5. Conclusions	» 177

J. C. BILELLO - Dislocation interactions.

1. Introduction	» 181
2. Elastic deformation	» 181
2'1. Brief review of linear elasticity theory	» 181
2'1.1. Stress	» 181
2'1.2. Strain	» 184
2'1.3. Compatibility	» 185
2'1.4. Generalized Hooke's law	» 186
2'1.5. Solution of the elastic problem	» 188
2'2. Modulus defect	» 189
2'2.1. Measurement of Young's modulus	» 189
2'2.2. Modulus defect	» 191
3. Dislocated crystals	» 193
3'1. Concept of stress field, energy and line tension of a dislocation	» 193
3'1.1. Stress field	» 193
3'1.2. Dislocation energy—Line tension	» 196
3'2. Shape change for a dislocated crystal	» 198
3'2.1. Dislocation tensor	» 198
3'2.2. Evaluation of the dislocation tensor for a given array	» 199
3'2.3. Curvature tensor	» 200
3'3. Elastic interactions between dislocations	» 203
3'3.1. Peach-Koehler (PK) force	» 203
4. Dislocation interactions with localized obstacles	» 209
4'1. What is a localized obstacle?	» 209
4'2. Dislocation break-away (dilute obstacles)	» 212
4'3. Dynamic interaction of moving dislocations with random array of localized obstacles	» 215
4'4. Some experimental results for Cu-1 % Si crystals	» 218
4'4.1. Microstrain measurements	» 218
5. Dislocation damping	» 223
5'1. Low-frequency mechanical hysteresis	» 223
5'2. Dislocation-phonon interaction	» 227
5'2.1. Granato-Lücke theory	» 227
6. Dislocation interactions with interfaces	» 233
6'1. Dislocation pile-up; plastic constraint	» 233

J. FRIEDEL – Surfaces and interfaces of metals.

Introduction	pag. 241
1. Form of a free surface. Macroscopic study	» 242
1'1. Equilibrium forms. Surface tension	» 242
1'1.1. Isotropic surface tension	» 242
1'1.2. Anisotropic surface tension	» 246
1'2. Evolution towards equilibrium by thermal diffusion	» 249
2. Form of a free surface. Microscopic study	» 252
2'1. A simple model	» 252
2'1.1. Equilibrium form at 0°K	» 253
2'1.2. Equilibrium form at $T \neq 0^{\circ}\text{K}$	» 254
2'1.3. Small deviations from equilibrium	» 258
2'1.4. Large deviations from equilibrium. Hysteresis	» 258
2'2. More realistic cases. Relaxation. Reconstruction	» 260
2'2.1. Normal relaxation	» 260
2'2.2. Parallel relaxation	» 261
2'2.3. Reconstruction	» 262
Appendix A – Surface relaxation for the (100)-surface of a simple cubic crystal.	» 263
3. Phonons	» 264
3'1. Macroscopic long-wavelength limit. Rayleigh waves	» 264
3'1.1. Isotropic case	» 264
3'1.2. Anisotropic cases.	» 265
3'2. Microscopic study	» 266
3'2.1. General treatment	» 267
3'2.2. High-temperature surface vibrational entropy	» 269
Appendix B – Volume and surface instabilities in a simple case	» 272
4. Electronic structure of free surfaces	» 273
4'1. Self-consistent potential.	» 273
4'2. One-electron wave functions.	» 275
4'3. Surface	» 276
4'3.1.	» 276
4'3.2.	» 276
4'4. Surface plasmons	» 278
4'5. Surface tension	» 279
4'5.1. Normal metals	» 279
4'5.2. Transition metals	» 280
5. Interfaces	» 283
5'1. Types of interfaces	» 283
5'2. Contact between two crystals of the same phase. (Grain boundaries.)	» 283
5'2.1. Geometry	» 283
5'2.2. Role in plasticity	» 287
5'2.3. Measurements of grain boundary tension	» 287
5'2.4. Electronic structure	» 289

5.3. Epitaxial interfaces.	pag. 294
5.3.1. Geometry	» 294
5.3.2. Electronic structure	» 295

G. CAGLIOTTI – An introduction to lattice dynamics.

1. Lattice dynamics as a connection between atomic structure and mechanical properties of metals	» 300
2. Experimental methods of neutron spectrometry for the determination of the dispersion relations and the polarization vectors of a crystal	» 301
2.1. The cross-section of a crystal for inelastic scattering of neutrons, as a response of the crystal to the spectroscopic stimulus (\mathbf{Q}, ω)	» 303
2.2. Elements of lattice dynamics	» 305
2.3. Interplanar force constants	» 307
2.4. Experimental methods of neutron spectrometry	» 308
3. A simple lattice dynamics model for the evaluation of surface energy for brittle fracture of simple cubic metals	» 310
4. Concluding remarks	» 314

S. BOFFI – Lattice dynamics and Green's function approach to crystal defects.

1. Lattice dynamics of a perfect crystal.	» 315
1.1. Equations of motion of a perfect crystal.	» 315
1.2. Symmetry properties of the atomic force constants . .	» 317
1.3. The cyclic boundary condition and the reciprocal lattice	» 319
1.4. The dynamical matrix	» 321
1.5. Normal co-ordinates and phonons	» 323
1.6. Interplanar force constants	» 327
2. The lattice Green's function	» 330
2.1. Thermal equilibrium	» 331
2.2. Response to an external perturbation	» 332
2.3. The Green's function of a perfect lattice	» 335
2.4. Inelastic neutron scattering	» 339
2.5. The anharmonic crystal.	» 344
2.6. The continuum model of the crystal.	» 347
2.7. The Green's function for lattice statics.	» 349
3. Lattice dynamics approach to point defects.	» 351
3.1. Equations of motion with defect	» 352
3.2. Resonance and localized modes	» 353
3.3. The Green's function of an imperfect lattice	» 356
3.4. Lattice distortion by point defects.	» 359
3.5. Defect formation energy	» 362
3.6. Defect migration energy	» 364

4. Lattice dynamics approach to extended defects	pag. 366
4'1. Lattice distortion around a dislocation	» 367
4'2. The Peierls stress for a dislocation	» 369
4'3. Localized modes associated with a dislocation	» 373
4'4. Dislocation-phonon interaction.	» 375
4'5. Surface energy for brittle fracture	» 378

V. CELLI and V. BORTOLANI – Pseudopotential theory of defects in metals.

Introduction: The general idea of a pseudopotential	» 387
1. Pseudopotentials in band theory	» 388
2. Atomic pseudopotentials and crystal pseudopotentials	» 392
3. The fitting of experimental data	» 399
4. The structural energy	» 404
4'1. Higher-order terms	» 407
4'2. Depletion hole and effective masses	» 408
4'3. Extension to transition metals	» 410
5. Point defects in metals	» 412
6. Stacking faults, dislocations and surfaces	» 422

G. T. HAHN – Mechanics and metallurgy of fracture.

1. Introduction	» 436
2. Criteria for crack extension and material toughness indices	» 439
2'1. Criterion for crack extension	» 439
2'2. Evaluating the strain energy release rate and fracture energy G_c (or R)	» 443
2'3. The stress intensity factor	» 445
2'4. Evaluating K_{fc}	» 449
2'5. The J -integral	» 450
2'6. The crack (tip)-opening displacement COD _c	» 452
2'7. Relations among fracture mechanics toughness indices and toughness values	» 453
3. The crack tip stress-strain environment	» 454
3'1. Properties of the linear elastic, near-tip stress field	» 456
3'2. Properties of the plastic zone	» 458
3'3. Properties of the region of large plastic stretch	» 459
4. Crack extension by cleavage	» 461
4'1. Brittle cleavage of single crystals	» 461
4'2. Ductile cleavage of single crystals	» 466
4'3. Cleavage crack extension in polycrystals	» 472

5. Crack extension by the fibrous mode	pag.	475
5'1. Mechanism of fibrous crack extension	»	475
5'2. Void nucleation	»	475
5'3. Void growth	»	478
5'4. The linking-up process	»	479
5'5. Metallurgical factors affecting fracture toughness	»	482
G. ANGELINO – New approaches to experimental determination of fracture mechanics parameters.		
Introduction	»	491
1. Determination of fracture mechanics parameters on the basis of the L_c concept	»	492
1'1. Theoretical background	»	492
1'2. Comparison with Feddern's method	»	496
1'3. Experimental method	»	496
1'4. Experimental tests and results	»	497
1'5. Discussion	»	502
1'6. Final remarks	»	503
2. Determination of fracture mechanics parameters on the basis of the Γ_c concept	»	504
2'1. Theoretical background	»	504
2'2. Experimental tests and results	»	510
2'3. Discussion	»	513
3. Concluding remarks	»	513
G. BENEDEK – The dynamical approach to lattice instabilities: fracture and surface reconstruction.		
1. Introduction	»	516
2. Dynamical aspects of lattice instabilities	»	518
3. Fracture	»	519
3'1. The exp-exp interplanar potential	»	519
3'2. The $m-n$ interplanar potential	»	521
4. Surface reconstruction	»	523
M. MIRABILE – Optimization of mechanical properties of ma- terials via A.E. studies.		
1. Introduction	»	526
2. The A.E. technique	»	526
3. Materials characterization	»	527
4. Plastic-deformation mechanisms	»	529
5. Some aspects of A.E. studies of fracture mechanisms	»	535
6. Conclusions	»	536

H. C. KIM – Characterization of mechanical properties by acoustic-emission techniques.

1. Introduction	pag. 538
2. Experimental	» 541
3. Acoustic emission in single crystals.	» 542
3'1.	» 543
3'2.	» 544
3'3. Acoustic-emission energy release during three stages of work-hardening in NaCl and LiF single crystals	» 545
3'4. Acoustic-emission energy release as a function of dislocation density	» 547
3'5. Size effect on the acoustic-emission energy release in single crystals	» 548
3'6. A new approach to acoustic-emission energy release during work-hardening	» 551
4. Acoustic emission in polycrystalline materials	» 552
4'1. Experimental	» 553
4'2. Results	» 553
4'3. Discussion	» 557
5. Acoustic emission in composites	» 559
5'1. Experimental. Specimen preparation and mechanical testing	» 559
5'2. Results and discussion	» 559
5'2.1. Continuous tensile test	» 559
5'2.2. Step-up microstrain cycling at cross-head speed of 0.05 cm/min.	» 560
5'2.3. Cycling at constant load amplitude at cross-head speed of 0.05 and 50 cm/min	» 561
5'2.4. Wave form analysis	» 565
6. Three stages of acoustic-emission energy release during cyclic deformation	» 567

G. KOSTORZ – The study of structural defects by neutrino scattering.

1. Introduction	» 571
2. Precipitates and small-angle scattering	» 571
3. Diffuse scattering	» 576
3'1. Short-range order	» 576
3'2. Strain fields	» 579
4. Concluding remarks	» 582

P. SCHILLER, A. SCHNEIDERS and H. NIJMAN – Internal friction,
a means to study point defects. The system Nb+O+H.

1. Introduction	pag. 585
2. The relaxation of point defects observed by internal friction	» 586
3. The possible interstitial sites in the b.c.c. lattice	» 590
4. The motion of the interstitials and the interaction with stress fields.	» 593
5. The relaxation spectrum in Nb loaded with different gases	» 594
6. Summary	» 600

G. PIATTI – Preparation of new multiphase composites.

1. Introduction	» 602
2. Whiskers.	» 603
3. Metallic composites reinforced with fibers	» 613
4. Metallic composites obtained by « <i>in situ</i> growth » of the fibers	» 617
5. Eutectic reactions.	» 619
6. Morphology and structure of the crystals obtained by « <i>in situ</i> » growth of lamellae and filaments.	» 628
7. Hypoeutectic or hypereutectic reactions (dendrites and cellular macrostructures)	» 636
8. Other reactions.	» 647
9. Conclusions.	» 648

D. BIRCHON – Environmental influence on mechanical behaviour.

1. The responsibility of the materials engineer	» 654
2. The effect of the environment on mechanical properties	» 655
3. The partition process	» 656
4. Strength, stiffness, hardness, toughness and fracture	» 657
5. Corrosion, corrosion-fatigue and stress-corrosion	» 657
6. Summing up	» 660
