

Contents

1. Introduction	1
2. Thermodynamics	6
2.1 Systems	9
2.2 State Variables	10
2.3 Equations of State	12
2.4 First Law of Thermodynamics	15
2.5 Second Law of Thermodynamics	18
2.6 Thermal Efficiency	20
2.7 Reversibility and Entropy	22
2.8 Chemical Potential.	27
2.9 Thermodynamic Potentials	29
2.10 Equilibrium	35
2.10.1 General criteria	35
2.10.2 Interphase mass transfer	37
2.11 Chemical Equilibrium	41
2.12 Thermochemical Calculations	53
2.12.1 General discussion and approximations	53
2.12.2 Sources for thermochemical data	61
Problems	63
3. Phase Equilibria and Phase Diagrams	66
3.1 Clausius-Clapeyron Relation	68
3.2 Gibbs Phase Rule.	72
3.3 Monocomponent Systems	74
3.4 Binary Systems	81
3.4.1 Definitions and general remarks.	81
3.4.2 Ideal solutions	85
3.4.3 Real solutions	92
3.4.4 Invariant transitions	100

3.4.5 Ordered and intermediate phases	108
3.4.6 Congruent and incongruent melting	112
3.4.7 Vapor-liquid-solid equilibria	115
3.5 Ternary Systems	135
3.6 Sources for Phase Diagrams and Solubility Data	141
Problems	143
4. Crystal Growth and Phase Diagrams	145
4.1 The Ideal System	147
4.2 Classification of Fluid to Solid Processes	148
4.3 Liquid-Solid Equilibria	150
4.3.1 Congruent and incongruent solidification	151
4.3.2 Crystallization from solutions	168
4.4 Vapor-Condensed Phase Equilibria	182
4.4.1 Vapor composition control	186
4.4.2 Vapor-solid equilibria	190
4.5 Container Materials	210
Problems	213
5. Mass Transport and Heat Transfer	215
5.1 Fluxes and References Frames	219
5.2 Diffusion	223
5.2.1 Driving potentials	223
5.2.2 Concentration or ordinary diffusion	226
5.2.3 Diffusion coefficients	234
5.2.4 Thermal diffusion	244
5.2.5 Pressure diffusion	250
5.2.6 Forced diffusion (electromigration)	251
5.3 Forced Convective Flow	253
5.3.1 Equations of change	253
5.3.2 Flow near solid-fluid interfaces	257
5.3.3 Viscosities	270
5.4 Convective-Diffusive Mass Transfer	278
5.5 Non-Radiative Heat Transfer	296
5.5.1 Basic equations for non-radiative transfer	297

5.5.2	Coupled interfacial heat and mass transfer	301
5.5.3	Correlations of solutions to mass and heat transfer problems	303
5.5.4	Thermal diffusivities and boundary layers	305
5.6	Radiative Heat Transfer	308
5.6.1	Fundamental concepts	309
5.6.2	Applications of the radiative transfer concepts	332
5.6.3	Combined conductive-convective-radiative heat transfer	340
5.7	Stefan Problems	341
5.8	Free Convection	342
5.8.1	Introductory Remarks	343
5.8.2	Buoyancy-driven convection	347
5.8.3	Surface-Tension-Driven Convection	387
	Problems	391
6.	Segregation	395
6.1	Segregation Coefficients	396
6.2	Equilibrium Segregation	399
6.2.1	Thermodynamics of segregation.	399
6.2.2	Experimental observations.	406
6.3	Steady-State Segregation.	413
6.3.1	Segregation in growth from a nutrient of uniform density	416
6.3.2	Segregation in growth from a nutrient of non-uniform density	420
6.3.3	Experimental observations	420
6.4	Macrodistribution	427
6.4.1	Normal freezing	427
6.4.2	Zone melting	432
6.4.3	Uniform composition	444
6.5	Microdistribution	449
6.5.1	Non-steady segregation	450
6.5.2	Non-equilibrium segregation	478
	Problems	492

Appendices

A. Universal Gas Constant	494
B. Thermodynamic Functions	496
C. Derivations of some Relations Used in Sect. 5.2	497
References	500
Subject Index	520
