PREFACE	ix
Chapter 1. INTRODUCTION	1
§ 1. A superheated liquid as a particular case of metastable states ..	1
§ 2. The binodal and spinodal. The critical point. The thermo- dynamic stability of the phase	4
§ 3. The equation of state	10
§ 4. The metastable states and surface tension	12
§ 5. Time characteristics of the processes when a new phase is separated	15
Chapter 2. THE THERMODYNAMICS OF THE INITIAL STAGE OF THE LIQUID — VAPOR PHASE TRANSITION	18
§ 6. The work of bubble formation	18
§ 7. The dependence of the surface tension on the radius of curvature	20
§ 8. Vapor pressure in the nucleating drop	22
§ 9. Work of formation of the critical bubble on the wall	24
§ 10. The stability of the metastable phase and nucleation kinetics ..	27
§ 11. The Döring-Volmer theory	29
§ 12. The Zel'dovich-Kagan theory	32
§ 13. Time of establishment of the steady state	41
§ 14. Some remarks on the nucleation theory	45
§ 15. Special features of the homogeneous nucleation theory in supersaturated vapor and in supercooled liquid	50
Chapter 3. EXPERIMENTAL STUDY OF THE MAXIMUM LIQUID SUPERHEAT	55
§ 16. The experiments of Wismer	55
§ 17. Superheating of liquid in open capillaries	58
§ 18. Superheating of liquid during heat exchange with the wall ...	59
§ 19. Experiments with bubble chambers	61
§ 20. Droplet superheating in a liquid medium	66
§ 21. Experiments with droplets at different pressures	72
§ 22. Breaking of liquids on tension	79

Chapter 4. NEW METHODS FOR STUDYING NUCLEATION KINETICS . .	83
§ 23. Formation of the spontaneous embryo as a random event . . .	83
§ 24. Determination of the mean lifetime of a superheated liquid . .	85
§ 25. Impact conditions of boiling of liquid. Pulse heating method .	90
§ 26. Experimental techniques with thin wires	96
§ 27. The method of pulse heating of a liquid .	
Some results	101
§ 28. Methods of light scattering	107
Chapter 5. EXPERIMENTAL CONFIRMATION OF THE HOMOGENEOUS NUCLEATION THEORY	109
§ 29. Preliminary remarks	109
§ 30. The thermodynamic properties of the liquids studied	111
§ 31. The maximum liquid superheat during floating of droplets . . .	113
§ 32. Confirmation of the nucleation theory over a wide range of nucleation frequencies	116
§ 33. Discussion of the results of a comparison between theory and experiment	122
§ 34. Surface tension of the nucleated bubbles	125
§ 35. Nucleation kinetics during condensation	129
§ 36. Crystallization of supercooled liquids	136
Chapter 6. EXPLOSIVE BOILING OF LIQUIDS UNDER PULSE HEATING . .	143
§ 37. Boiling centers and bubble growth in a superheated liquid	143
§ 38. Boiling under quasisteady-state conditions	151
§ 39. Thermal calculation of the initial stage of explosive boiling . .	159
§ 40. Fluctuation nucleation in the presence of ready centers	168
§ 41. Development of explosive boiling during pulse heating of the wire	170
§ 42. Crisis of boiling and liquid superheat	172
Chapter 7. INITIATED NUCLEATION	178
§ 43. The mechanism of initiating bubbles with ionizing particles . .	178
§ 44. Experimental study of initiated boiling	181
§ 45. Effect of the radiation background on nucleation kinetics . . .	189
§ 46. Phenomenological description of the initiation effect	191
Chapter 8. SPECIFIC VOLUMES AND EQUATIONS OF STATE OF A METASTABLE LIQUID	199
§ 47. Two types of isotherms in a liquid—vapor system	199
§ 48. Method and techniques of piezometric experiments	200
§ 49. The specific volumes of liquid n-hexane in the stable and metastable states	202
§ 50. The equation of state of a superheated liquid	205
§ 51. Determination of the vapor pressure in a critical bubble	206

Chapter 9. THE THERMODYNAMICS OF THE SPINODAL	209
§ 52. The spinodal by the van der Waals equation	209
§ 53. The spinodal as the envelope of a family of isochores, adiabatic and isoenthalpic curves in p, T variables	211
§ 54. Asymptotic behavior of the thermodynamic parameters on the stability boundary	217
§ 55. The spinodal and surface tension	220
§ 56. The surface of internal energy	222
§ 57. Model representation and the "rectilinear diameter" rule	223
§ 58. The spinodal according to the hole theory of Furth	226
§ 59. Approximation of the spinodal	231
Chapter 10. DENSITY FLUCTUATIONS IN METASTABLE AND NEAR CRITICAL STATES	238
§ 60. Fluctuation and spontaneous nucleation	238
§ 61. Density fluctuations near the critical point	241
§ 62. Light scattering by a pure substance. Critical opalescence . . .	243
§ 63. The pattern of light scattering over a wide interval near the critical point	245
§ 64. Dispersion of scattering and correlation length	251
§ 65. Checking the Ornstein-Zernike theory	254
§ 66. Transfer phenomena near the critical point	258
BIBLIOGRAPHY	264
