

Contents

1

Semiclassical introduction 1

- 1.1. *Elementary excitations* 2
- 1.2. *Phonons* 5
- 1.3. *Magnons* 8
- 1.4. *Plasmons* 11
- 1.5. *Helicons* 14
- 1.6. *Electron quasi-particles* 16
- 1.7. *The electron-phonon interaction* 19
- Problems* 21

2

Second quantization and the electron gas 25

- 2.1. *A single electron* 26
- 2.2. *Occupation numbers* 30
- 2.3. *Second quantization for fermions* 33
- 2.4. *The electron gas and the Hartree-Fock approximation* 39
- 2.5. *Perturbation theory* 47
- 2.6. *The density operator* 52
- 2.7. *The random phase approximation and screening* 55
- 2.8. *Spin waves in the electron gas* 66
- Problems* 70

3

Boson systems 73

- 3.1. *Second quantization for bosons* 74
- 3.2. *The harmonic oscillator* 75
- 3.3. *Quantum statistics at finite temperatures* 78
- 3.4. *Bogoliubov's theory of helium* 82
- 3.5. *Phonons in one dimension* 88
- 3.6. *Heat currents* 92
- 3.7. *Phonons in three dimensions* 94
- 3.8. *Acoustic and optical modes* 97
- 3.9. *Densities of states and the Debye model* 100
- 3.10. *Phonon interactions* 103
- 3.11. *Magnetic moments and spin* 108
- 3.12. *Magnons* 114
- 3.13. *Magnon interactions* 118
- Problems* 122

4

One-electron theory of metals 125

- 4.1. *Bloch electrons* 126
- 4.2. *Core states and the pseudopotential* 141
- 4.3. *Exact calculations, relativistic effects, and the structure factor* 148
- 4.4. *Dynamics of Bloch electrons* 158
- 4.5. *Scattering by impurities* 169
- Problems* 172

5

Electron–phonon interactions 175

- 5.1. *The Fröhlich Hamiltonian* 176
- 5.2. *Phonon energies and the Kohn effect* 178
- 5.3. *Polarons and mass enhancement* 182
- 5.4. *The attractive interaction between electrons* 186
- 5.5. *The Nakajima Hamiltonian* 189
- Problems* 192

6

Superconductivity 195

- 6.1. *The superconducting state* 196
- 6.2. *The BCS Hamiltonian* 198
- 6.3. *The Bogoliubov–Valatin transformation* 201
- 6.4. *The ground-state wave function and the energy gap* 207
- 6.5. *The transition temperature* 211
- 6.6. *Ultrasonic attenuation* 215
- 6.7. *The Meissner effect* 217
- 6.8. *Tunnelling experiments* 221
- 6.9. *Flux quantization and the Josephson effect* 228
- 6.10. *The Ginzburg–Landau equations* 235
- Problems* 243

7

Semiclassical theory of the conductivity of metals 245

- 7.1. *The Boltzmann equation* 246
- 7.2. *Calculating the conductivity of metals* 248
- 7.3. *Effects in magnetic fields* 253
- 7.4. *Inelastic scattering and the temperature dependence of resistivity* 261
- 7.5. *The resistance minimum and the Kondo effect* 266
- 7.6. *Thermal conductivity in metals* 272
- 7.7. *Thermoelectric effects* 276
- Problems* 281

8

Perturbation theory to infinite order 283

- 8.1. *Dyson's equation and the random alloy problem* 284
- 8.2. *An application to lattice dynamics* 290
- 8.3. *Localized modes* 294
- 8.4. *Conductivity and the Greenian* 298
- 8.5. *Derivation of the Boltzmann equation* 301
- 8.6. *Lattice conductivity and second sound* 307
- Problems* 310
