Physics of the Hydrogen Maser

C. Audoin, J. P. Schermann, and P. Grivet

I. Introduction 2
II. Hydrogen Maser Techniques 5
III. Dynamical Behavior of the Maser 8
IV. Hyperfine Spectroscopy 29
V. Interaction of Atomic Hydrogen with Radio Frequency Fields 33
References 42

Molecular Wave Functions: Calculation and Use in Atomic and Molecular Processes

J. C. Browne

I. Introduction and General Principles 47
II. Computations of Wave Functions, Potential Surfaces, and Coupling Matrix Elements 53
III. Some Results and Expectations for the Future 78
IV. Atom–Atom Scattering 79
V. Radiative Processes 83
References 87

Localized Molecular Orbitals

Harel Weinstein, Ruben Pauncz, and Maurice Cohen

I. Introduction 97
II. Density Matrix Formalism 99
III. The Edmiston–Ruedenberg Localization Method 102
IV. The Method of Boys and Foster 109
V. Direct Localization Methods 116
VI. Internal and External Localization Criteria 121
VII. The Method of Magnasco and Perico 122
VIII. The Method of Peters 126
IX. Molecular Orbitals Determined from Localization Models 128
X. Localized Orbitals in Expansion Methods 134
XI. Concluding Remarks 138
References 138

General Theory of Spin-Coupled Wave Functions for Atoms and Molecules

J. Gerratt

I. Introduction 141
II. Properties of the Exact Electronic Eigenfunction 144
III. Construction of the Spin Functions 147
IV. The Spin-Coupled Wave Functions 152
V. Calculation of Matrix Elements of the Hamiltonian 154
VI. The Orbital Equations 163
VII. Symmetry Properties of the Spin-Coupled Wave Functions 168
VIII. The Hund's Rule Coupling 180
IX. The General Recoupling Problem and Bonding in Molecules 194
X. Conclusions 206
Note Added in Proof 207
Appendix A. Proof of the Relations (59)–(62) 207
Appendix B. Matrix Elements of Spin-Dependent Operators 211
Appendix C. Proof That the Orbital Equations Are Invariant under $\mathscr{H}$ 213
Appendix D. Proof That the Operators $F^{(\alpha)}$ and $F^{(\beta)}$ Are Invariant under Unitary Transformations of the ϕ_u and ψ_u Sets of Orbitals 215
References 219

Diabatic States of Molecules—Quasistationary Electronic States

Thomas F. O'Malley

I. Introduction 223
II. Mathematical Preliminaries 225
III. Molecular Ground States—The One-State Problem—The Stationary Adiabatic Representation 228
IV. The Na + Cl Two-State Problem—Covalent and Ionic States 230
V. Charge Exchange in Helium—Single Configuration Diabatic States 232
VI. Dissociative Recombination and Attachment—The Quasistationary State Representation 236
VII. Slow Heavy-Particle Collision Theory—Extension of the Quasistationary Representation to Rydberg States 243
VIII. Summary and Conclusion 245
References 248

Selection Rules within Atomic Shells

B. R. Judd

I. Introduction 252
II. Groups 252
III. Irreducible Representations 258
IV. Generalized Triangular Conditions 270
V. Generators 273
VI. Conflicting Symmetries 276

VII. Oriented Spins 280
VIII. Special Cases 282
IX. Conclusion 284
References 285

Green's Function Technique in Atomic and Molecular Physics

Gy. Csanak, H. S. Taylor, and Robert Yaris

I. Introduction 288
II. Many-Particle Green's Function and Physical Quantities 290
III. Coupled System of Equations for Green's Functions (The Method of Functional Differentiation; The Dyson Equation; The Bethe–Salpeter Equation) 305
IV. Scattering 321
V. Nonperturbative Approximation Method 330
VI. Perturbation Methods 339
Appendix A 354
Appendix B 358
Appendix C 359
References 360

A Review of Pseudo-Potentials with Emphasis on Their Application to Liquid Metals

Nathan Wiser and A. J. Greenfield

I. Introduction 363
II. Underlying Ideas of the Pseudopotential 365
III. Simplification of the Form Factor 370
IV. Formulations of $v(q)$ Useful for Liquid Metals 374
V. Screening 381
VI. Comments about the Various Pseudopotentials 384
VII. Conclusions 385
References 386
