Contents

1 The Measurement of Vibrational Relaxation Times in Gases

1.1 Introduction 1
1.2 Acoustic methods 6
1.2.1 The propagation of sound in a relaxing gas . 7
1.2.2 Acoustic instruments 27

2 Vibrational Energy Exchange at Molecular Collisions

2.1 Introduction 58
2.2 Calculation of the transition probabilities . . . 60
2.2.1 One-dimensional collision between an atom and a diatomic molecule 62
2.2.2 Three-dimensional collision 69
2.2.3 The intermolecular potential 72
2.2.4 Completion of the quantum-mechanical calculation of the inelastic cross-section: the SSH–Tanczos formula 75
2.2.5 Vibrational and steric factors 79
2.2.6 Discussion of the methods of calculation . . 81
2.3 Calculation of relaxation times from transition probabilities 89
2.3.1 The SSH–Tanczos method of rate equations . 90
2.3.2 The Bauer method using irreversible thermodynamics 96
2.3.3 Schuler's investigations of relaxation . . 99
2.3.4 The calculation of transition probabilities from experimental results: series and parallel excitation 100
2.4 Review of experimental relaxation times and comparison with theoretical ones 103
2.4.1 Pure gases and mixtures with only one relaxing component 103
2.4.2 Binary mixtures containing two relaxing components 140

2.5 General discussion 164
2.5.1 The effect of rotation 164
2.5.2 Conclusion 168

3 The Measurement of Vibrational Relaxation Rates by Shock Techniques
3.1 Introduction 180
3.1.1 Scope of the chapter 180
3.1.2 Some terminology and conventions: Napier time, vibrational states and levels, relaxation . . 181
3.2 Methods for studying vibrational relaxation . . . 185
3.2.1 The simple shock tube 186
3.2.2 Ancillary shock methods: expansions . . 188
3.2.3 Ultrasonic methods 189
3.2.4 The spectrophone 190
3.2.5 Flash photolysis 191
3.2.6 Infrared fluorescence 192
3.2.7 Ultraviolet fluorescence 192
3.2.8 A Raman method 192
3.2.9 Summary 193
3.3 Elementary shock-tube theory 193
3.3.1 The wave patter in a simple shock tube . . 193
3.3.2 Coordinate systems and nomenclature . . 195
3.3.3 Conservation equations: the Rankine–Hugoniot relations 196
3.3.4 The Hugoniot relation 197
3.3.5 Solution of the conservation equations for ideal gases 201
3.3.6 Solution of the conservation equations for gases with active vibrations 205
3.3.7 Compression of the observation time . . 206
3.3.8 Shock experiments in real gases . . . 209
3.3.9 Miscellaneous equations for calculation of shock-tube parameters 210
3.3.10 Reflected shock 211
3.4 Experimental methods in shock tubes 212
3.4.1 Construction 212
3.4.2 Velocity measurements 212
3.4.3 Techniques for relaxation measurements . . 213

3.4.4 Interferometry 213
3.4.5 Schlieren and other densitometry techniques; the theory of density changes 214
3.4.6 Line and band-reversal techniques . . . 216
3.4.7 Infrared fluorescence 219
3.4.8 Ultraviolet fluorescence and absorption . . 221
3.5 The adequacy of models used in the interpretation of Napier Times 222
3.5.1 Introduction 222
3.5.2 Two-state model 223
3.5.3 Landau–Teller model for an harmonic oscillator . 224
3.5.4 Mixtures 226
3.5.5 Absolute calculations of Napier times . . 228
3.5.6 Empirical suggestions 229
3.5.7 The applicability of the two-state and Landau–Teller models 230
3.5.8 Higher vibrational levels 232
3.5.9 Temperature dependence 235
3.5.10 Mixtures 240
3.6 Results for individual molecules 241
3.6.1 Table of Napier times 241
3.6.2 Hydrogen 243
3.6.3 Deuterium 244
3.6.4 Nitrogen 245
3.6.5 Oxygen 247
3.6.6 Air 249
3.6.7 Carbon monoxide 249
3.6.8 Nitric oxide 252
3.6.9 Hydrogen halides 254
3.6.10 Chlorine 255
3.6.11 Cyanide radical 255
3.6.12 Nitrous oxide 255
3.6.13 Carbon dioxide 256
3.6.14 Methane 258
3.7 Some conclusions 258

4 Molecular Relaxation Processes in Liquids
4.1 General considerations 265
4.1.1 Introduction 265

4.1.2 Energy of liquids 267
4.1.3 Relaxational coupling 268
4.1.4 The interaction of acoustic waves with liquids . 269
4.2 Experimental methods 282
4.2.1 Introduction 282
4.2.2 Resonance and resonance-reverberation methods . 284
4.2.3 Tuning fork 285
4.2.4 Acoustic streaming 286
4.2.5 Pulse methods 288
4.2.6 Optical method 290
4.2.7 Radiation pressure 291
4.2.8 Ultrasonic interferometer 292
4.2.9 Comparison measurements 294
4.2.10 Brillouin spectroscopy 295
4.3 Analysis of experimental data 296
4.3.1 Calculation of thermodynamic data . . . 296
4.3.2 Calculation of kinetic parameters . . . 302
4.3.3 Numerical example 304
4.4 Rotational isomerism 314
4.4.1 Substituted ethanes 314
4.4.2 Substituted cyclohexanes 329
4.4.3 Tertiary amines 334
4.4.4 Unsaturated molecules 338
4.5 Carboxylic acids 345
4.6 Vibrational relaxation 349
4.6.1 Introduction 349
4.6.2 Basic theory 349
4.6.3 Specific systems 353
4.6.4 General discussion 356

5 Collisional Excitation and Chemical Reaction
5.1 Introduction 368
5.2 The accumulation of vibrational energy . . . 368
5.3 Dissociation of diatomic molecules diluted in a large excess of an inert gas 374
5.4 Dissociation of undiluted diatomic gases . . . 377
5.5 Dissociation of polyatomic molecules 378
5.6 Bimolecular reactions 385
5.7 Conservation of spin in chemical reactions . . . 385
