Chapter 1. Classical Trajectory Methods in Molecular Collisions

Richard N. Porter and Lionel M. Raff

1. Introduction	1
1.1 Rationale for the Use of Classical Dynamics	1
1.2 Survey of Applications of Classical Calculations	3
2. Review of Classical Hamiltonian Mechanics	6
3. Classical Scattering, Cross Sections, and Rate Coefficients	11
3.1 Two-Particle Collisions	12
3.2 Atom–Diatomic Molecule Collisions	14
3.3 Diatomic–Diatomic Molecule Collisions	17
3.4 Atom–Triatomic Molecule Collisions	18
4. Statistical Averaging	20
5. Selection of Initial States	23
5.1 Relative Translation	23
5.2 Impact Parameter	26
5.3 Internal States	28
5.4 Initial Orientation	33
5.5 Vibrational Phase	33
5.6 Calculation of Initial Coordinates and Momenta	36
6. Integration of the Equations of Motion	39
6.1 Single-Step Methods	39
6.2 Multiple-Step Methods	42
6.3 Variable Time Steps	44
6.4 Checks on Trajectory Accuracy	45

7.	Analysis of Final States	46
7.1	Discrimination of Products	46
7.2	Relative Translation	47
7.3	Scattering Angle	47
7.4	Internal Energy	48
8.	Consecutive Collisions	49
9.	Prognosis for Classical Molecular Scattering Calculations	49
	References	50

Chapter 2. Features of Potential Energy Surfaces and Their Effect on Collisions

P. J. Kuntz

1.	Introduction	53
1.1	Molecular Collisions	53
1.2	Potential Energy Surfaces	54
2.	Potential Energy Surfaces and Dynamics	55
2.1	Separation of Electronic and Nuclear Motion	55
2.2	Classical Dynamics	56
3.	Potential Energy Representations	57
3.1	Introduction	57
3.2	Graphical Representations of Potentials	58
3.3	Functional Representations	61
3.4	Model Potentials	63
4.	Dynamical Principles of Reactive Collisions	69
4.1	The Problem of Rearrangement	69
4.2	Mass Effects	72
5.	Collinear Dynamics	73
5.1	Equations of Motion	73
5.2	Single-Particle Representation	74
5.3	Collinear Rearrangement Dynamics	77
5.4	Utility of Collinear Calculations	85
6.	Triatomic Systems	89
6.1	Introduction	89
6.2	Energy Distributions	90
6.3	Angular Distributions	96
6.4	Cross Sections	101
6.5	Complex Collisions	110
7.	Polyatomic Systems	112
7.1	Four-Atom Systems	112
7.2	Six-Atom Systems	113

8. Multipotential Systems	114
9. Summary	115
References	116

Chapter 3. Dynamics of Unimolecular Reactions

William L. Hase

1. Introduction	121
2. RRKM Theory	122
2.1 Assumptions	122
2.2 Microscopic Unimolecular Rate Constant	123
2.3 Critical Configuration	126
2.4 Non-RRKM Behavior	130
3. Applications of the RRKM Theory	132
3.1 Thermal Unimolecular Reactions	132
3.2 Chemical Activation	138
4. Unimolecular Dynamics	142
4.1 Intermolecular Energy Transfer	143
4.2 Intramolecular Energy Transfer	148
4.3 Energy Partitioning in Unimolecular Fragments	158
4.4 Status of the RRKM Theory	161
5. New Directions	163
References	164

Chapter 4. Semiclassical Methods in Molecular Collision Theory

M. S. Child

1. Introduction	171
2. Elements of the Theory	173
2.1 The JWKB Approximation	173
2.2 Uniform Approximations	175
2.3 Canonical Transformations	183
2.4 Energy–Time and Action–Angle Representations	187
3. The Semiclassical <i>S</i> Matrix	192
3.1 Elastic Scattering in a Central Field	192
3.2 Inelastic Scattering	197

4. Classical Path Approximations	203
4.1 Perturbation and Sudden Approximations	204
4.2 Correspondence Principle Approximations	206
4.3 The Impulse Approximation	210
References	212

Chapter 5. Nonadiabatic Processes in Molecular Collisions

John C. Tully

1. Introduction	217
2. Formulation of the Problem	220
2.1 Separation of Electronic and Nuclear Motion	220
2.2 Electronic Representations	223
2.3 Electronic Motion	228
3. Quantum Mechanical Methods	231
3.1 Classification of Collision Processes	231
3.2 Quantum Treatments of Nuclear Motion	233
4. Classical Mechanical Methods	238
4.1 Classical Path Equations	238
4.2 One-Dimensional Model Solutions	243
4.3 Surface-Hopping Approach	245
4.4 Multiple-Crossing Approach	249
4.5 Approximate Models	253
5. Semiclassical Methods	253
5.1 One-Dimensional WKB Approach	253
5.2 Path Integral Formulation	255
5.3 Complex-Valued Trajectory Approach	257
6. Conclusions	258
References	259

Chapter 6. Statistical Approximations in Collision Theory

Philip Pechukas

1. Introduction	269
2. Classical Transition State Theory of Direct Reactions	270
2.1 Once Over Lightly	270
2.2 Dynamical Foundations: A One-Dimensional Model	272
2.3 Dynamical Foundations: A Two-Dimensional Model	277

2.4	Multidimensional Potential Surfaces: Saddle Points, Counting Problems, and the Conservation of Nuclear Symmetry along Reaction Paths	285
3.	Quantum Transition State Theory of Direct Reactions	294
3.1	The Separable Approximation	294
3.2	Beyond the Separable Approximation	297
4.	Transition State Theory of Complex Reactions	304
4.1	Rates of Complex Formation and Decay	304
4.2	Dynamical Foundations	307
4.3	Loose Transition States and the Statistical Theory of Final State Distributions	312
	References	320

Chapter 7. Thermodynamic Approach to Collision Processes

R. D. Levine and R. B. Bernstein

1.	Introduction	323
2.	Information Content and Entropy	324
2.1	Introduction	324
2.2	The Thermodynamic Weight	325
2.3	Constraints	327
2.4	Equilibrium Statistical Thermodynamics	332
2.5	Bulk Disequilibrium	334
2.6	Epilogue and Prologue	336
3.	Thermodynamic Approach to Collision Processes	336
3.1	Microdisequilibrium	336
3.2	The Prior Distribution	337
3.3	Entropy and Surprisal	341
3.4	Surprisal Analysis	344
3.5	Surprisal Synthesis	348
3.6	Concept of Relevance	352
4.	Chemical Disequilibrium	354
4.1	The Well-Reasoned Choice	354
4.2	Analysis of Branching Ratios for Molecular Collisions	355
4.3	The Road Ahead	358
	Appendix	359
	References	360
