**PART I. SMALL-ANGLE SCATTERING AND THE  
STRUCTURE OF MATTER**

**1. Principles of the Theory of X-Ray and Neutron Scattering . . . . . 3**

1.1. Scattering of a Plane Wave by Matter . . . . . 3

1.2. Fourier Transforms. Convolutions . . . . . 6

1.3. Scattering by Simple Objects . . . . . 10

1.3.1. Rectangular Parallelepiped . . . . . 10

1.3.2. Homogeneous Thin Plate . . . . . 12

1.3.3. Homogeneous Thin Rod . . . . . 12

1.3.4. Inhomogeneous Parallelepiped . . . . . 13

1.3.5. Periodic Set of Centers . . . . . 13

1.3.6. Spherically Symmetric Body . . . . . 14

1.4. Scattering of X Rays by Atoms . . . . . 14

1.5. Scattering of Thermal Neutrons by Nuclei . . . . . 17

1.6. Absorption of X Rays and Neutrons . . . . . 22

1.7. Conclusion . . . . . 24

**2. General Principles of Small-Angle Diffraction . . . . . 25**

2.1. Scattering by Objects with Different Ordering . . . . . 25

2.1.1. Single Crystals . . . . . 26

2.1.2. One-Dimensional Periodic Structures . . . . . 27

2.1.3. Cylindrically Symmetric Objects . . . . . 28

2.1.4. Isotropic Systems . . . . . 29

2.2. Small-Angle Scattering by Disperse Systems . . . . . 30

2.2.1. Scattering Intensity by a Disordered Object . . . . . 30

2.2.2. Scattering at Low Angles . . . . . 33

2.3. Particle Solutions . . . . . 34

|                                                                           |    |
|---------------------------------------------------------------------------|----|
| 2.3.1. Monodisperse and Polydisperse Systems . . . . .                    | 34 |
| 2.3.2. Conception of Contrast . . . . .                                   | 35 |
| 2.3.3. Concentrated and Dilute Systems . . . . .                          | 36 |
| 2.4. Isolated Particle . . . . .                                          | 38 |
| 2.4.1. Debye Equation . . . . .                                           | 38 |
| 2.4.2. Correlation Function . . . . .                                     | 39 |
| 2.4.3. Uniform Particles . . . . .                                        | 40 |
| 2.4.4. Asymptotic Behavior of Intensity.<br>The Porod Invariant . . . . . | 45 |
| 2.4.5. Special Types of Particle . . . . .                                | 46 |
| 2.5. Nonparticulate Systems . . . . .                                     | 50 |
| 2.5.1. Scattering Due to Statistical Fluctuations . . . . .               | 50 |
| 2.5.2. Two-Phase and Multiphase Systems . . . . .                         | 52 |
| 2.6. Conclusion . . . . .                                                 | 55 |

## PART II. MONODISPERSE SYSTEMS

|                                                                           |           |
|---------------------------------------------------------------------------|-----------|
| <b>3. Determination of the Integral Parameters of Particles . . . . .</b> | <b>59</b> |
| 3.1. Geometrical and Weight Invariants . . . . .                          | 59        |
| 3.1.1. Total Scattering Length and Radius of Gyration . . . . .           | 60        |
| 3.1.2. Volume and Surface . . . . .                                       | 61        |
| 3.1.3. Largest Dimension and Correlation Length . . . . .                 | 62        |
| 3.1.4. Anisometric Particles . . . . .                                    | 63        |
| 3.2. Information Content in Small-Angle Scattering Data . . . . .         | 63        |
| 3.2.1. General Approach . . . . .                                         | 64        |
| 3.2.2. Number of Independent Parameters . . . . .                         | 65        |
| 3.3. Evaluation of the Invariants . . . . .                               | 68        |
| 3.3.1. Accuracy of Calculation of the Radius of Gyration . . . . .        | 68        |
| 3.3.2. Absolute Measurements. Molecular-Mass<br>Determination . . . . .   | 73        |
| 3.3.3. Possibilities of Homogeneous Approximation . . . . .               | 76        |
| 3.3.4. Estimate of the Largest Dimension . . . . .                        | 82        |
| 3.3.5. Evaluation of the Invariants of Anisometric Particles . . . . .    | 83        |
| 3.3.6. List of the Basic Equations . . . . .                              | 87        |
| 3.4. Scattering by Particles of Simple Shape . . . . .                    | 90        |
| 3.5. Modeling Method . . . . .                                            | 94        |
| 3.5.1. Demands on the Technique of Calculation . . . . .                  | 94        |
| 3.5.2. Subparticle Models . . . . .                                       | 95        |
| 3.5.3. Spheres Method . . . . .                                           | 95        |
| 3.5.4. Cube Method . . . . .                                              | 97        |
| 3.5.5. Modeling in Real Space . . . . .                                   | 98        |
| 3.6. Applications of Modeling . . . . .                                   | 98        |
| 3.6.1. <i>Helix pomatia</i> Hemocyanin . . . . .                          | 99        |

|                                                                             |            |
|-----------------------------------------------------------------------------|------------|
| 3.6.2. Bacteriophage S <sub>D</sub> . . . . .                               | 100        |
| 3.6.3. 30 S Ribosomal Subparticle . . . . .                                 | 102        |
| 3.7. Conclusion . . . . .                                                   | 104        |
| <b>4. Interpretation of Scattering by Inhomogeneous Particles . . . . .</b> | <b>107</b> |
| 4.1. Scattering by Inhomogeneous Particles . . . . .                        | 107        |
| 4.1.1. Solvent Influence . . . . .                                          | 108        |
| 4.1.2. General Equations for Intensity and Invariants . . . . .             | 110        |
| 4.1.3. Spherically Symmetric Particles . . . . .                            | 112        |
| 4.1.4. Large-Angle Scattering . . . . .                                     | 112        |
| 4.2. Contrast Variation . . . . .                                           | 115        |
| 4.2.1. Basic Functions . . . . .                                            | 115        |
| 4.2.2. Dependence of Invariants on Contrast . . . . .                       | 117        |
| 4.2.3. Contrasting Techniques . . . . .                                     | 118        |
| 4.2.4. Applications of the Contrast-Variation Technique . . . . .           | 122        |
| 4.3. Isomorphous-Replacement Methods . . . . .                              | 131        |
| 4.3.1. Heavy-Atom Labels . . . . .                                          | 131        |
| 4.3.2. The Triangulation Method . . . . .                                   | 132        |
| 4.4. Variation in the Applied Radiation . . . . .                           | 138        |
| 4.4.1. Combined Use of Various Types of Radiation . . . . .                 | 139        |
| 4.4.2. Anomalous (Resonant) Scattering . . . . .                            | 140        |
| 4.5. Conclusion . . . . .                                                   | 144        |
| <b>5. Direct Methods . . . . .</b>                                          | <b>147</b> |
| 5.1. One-Dimensional Density Distributions . . . . .                        | 148        |
| 5.2. Solving the One-Dimensional Sign Problem . . . . .                     | 150        |
| 5.2.1. Use of Correlation Functions . . . . .                               | 152        |
| 5.2.2. Box-Function Refinement . . . . .                                    | 153        |
| 5.3. Multipole Theory of Small-Angle Diffraction . . . . .                  | 156        |
