# CONTENTS

*Preface* v

Part I. STATIC FIELD SCATTERING

1. Classical Scattering and Quantum Formulation 1
2. Partial Wave Analysis 9
3. Scattering Matrix and Bound States 17
4. Resonance Effects 26
5a. Normalization of Continuum States 35
5b. Coulomb Scattering 40
6. Integral Equation Formulation 45
7. Variational Methods for Phase Shifts 50
8. Variational Methods for Scattering Amplitudes 60
9. Bounding Principle for Scattering Length 67
10. Nonspherical Potential Fields 73

Part II. ELECTRON-ATOM COLLISIONS

11. Formulation of Many-Channel Problem 82
12. Role of Pauli Principle 90
13. Integral Expression for Scattering Amplitude 95
14. Born, Bethe, and Oppenheimer Approximations 103
15. Variational Methods 115
16. Close Coupling Method 124
17. Ionization 133
18. Resonances and Compound Atom States 142
19. Threshold Behavior of Cross Sections 152
20. Anomalous Threshold Behaviors 160

Part III. ATOM-ATOM COLLISIONS

21. General Kinematic Considerations 168
22. Expansion in Molecular States 175
23. Identical Nuclei and the Pauli Principle 183
24. Impact Parameter Method and Perturbation Solutions 192
25a. Unitarized Approximation 199
25b. Variational Principle for Time-Dependent Case 203

26. Coupled Equations for Proton–Hydrogen Collisions 205
27. Crossing of Potential Energy Curves 213
28. Adiabatic Symmetric Charge Transfer 222
29. General Formulation for Rearrangement Collisions 230
30. Charge Transfer in Fast Collisions 237

Index 243
