PREFACE		ix
1.	COLLISIONS, POPULATIONS, ENERGY DISTRIBUTIONS	1
1.1.	Introduction. Types of collision process	1
1.2.	Collision cross-sections and rate coefficients; kinetic theory background	5
1.3.	Velocity and energy distributions	13
1.4.	Diffusion of particles	18
1.5.	Some problems in the calculation of cross-sections and of populations	23
1.6.	Thermodynamic relations	27
2.	THEORETICAL BACKGROUND—CLASSICAL AND QUANTUM	30
2.1.	Introduction	30
2.2.	The force field between an electron and an atom	31
2.3.	The force fields between atomic systems	32
2.4.	Transitions in diatomic molecules. The Franck-Condon principle	38
2.5.	Coordinate systems and energy relations	41
2.6.	Energy losses in collisions between impenetrable elastic spheres	43
2.7.	Classical binary encounter treatment of some inelastic collisions	45
2.8.	Classical theory of elastic scattering in a central force field	49
2.9.	Quantum theory of collisions. Introduction	51
2.10.	The Ramsauer-Townsend effect	54
2.11.	Born's approximation	55
2.12.	The principle of detailed balancing	57
2.13.	Jeffreys' approximation	58
2.14.	Impact parameter formulation. Method of perturbed stationary states	59
2.15.	Variational methods	60
2.16.	The distorted wave approximation	61
2.17.	Effective range theory, and the method of 'bounds'	61
3.	THE EXPERIMENTAL METHODS EMPLOYED IN COLLISION PHYSICS	65
3.1.	Introduction	65
3.2.	Sources of atomic and molecular beams	66
3.3.	Sources of atomic hydrogen and similar beams	71
3.4.	Sources of electrons	74
3.5.	Sources of photons in the visible and ultra-violet	83
3.6.	Sources of ions	87

Page

3.7. Sources of excited atoms and molecules 100
3.8. Velocity selection of atomic and molecular beams . . 104
3.9. Velocity selection of electrons 107
3.10. Detection and wavelength measurement of photons . . 114
3.11. Velocity and mass selection of ions 117
3.12. Detection and counting of charged particles and fast neutrals 128
3.13. Detection of atomic and molecular beams . . . 136
3.14. Detection of metastable atoms and molecules . . . 141
3.15. Some relevant vacuum problems 142
3.16. Sampling and probing of plasmas 147
3.17. The use of quadrupole fields 156

4. The Elastic Scattering of Electrons in Gases . . . 169
4.1. Introduction. Total collision cross-sections . . . 169
4.2. Electron swarm experiments 174
4.3. Collision frequencies determined by microwave techniques 185
4.4. Crossed beam electron-atom collision experiments . . 190

5. Excitation of Atoms and Molecules by Electrons. . . 196
5.1. Introduction 196
5.2. Electron beam experiments on the excitation of allowed levels by measurement of radiation 199
5.3. Other methods of excitation function measurement . . 203
5.4. Further experiments on excitation to metastable levels . 206
5.5. Quantum theory calculations of excitation cross-sections; comparison of theory with experiment 211
5.6. Polarization of radiation 215
5.7. Studies of electron exchange 217
5.8. Excitation of positive ions 219
5.9. Vibrational and rotational excitation of molecules by electrons 220
5.10. Dissociation of molecules by electron impact . . . 224

6. Ionization by Electrons 229
6.1. Introduction, form of atomic cross-section functions . . 229
6.2. Experiments with fine energy resolution of electrons . . 233
6.3. Threshold laws of cross-section functions . . . 235
6.4. The ionization of molecules 241
6.5. Doubly charged molecular ions 247
6.6. Ionization of positive ions 249

7. Positive Ion Recombination 254
7.1. Introduction 254
7.2. Electron-ion recombination processes as expected in theory 254
7.3. The measurement of electron-ion recombination coefficients 259
7.4. Probe measurements in afterglows 260
7.5. Microwave studies of recombination in afterglows . . 261
7.6. Interpretation of modern data, helium and other rare gases 264

Page

7.7. Interpretation of modern data for N_2, O_2, H_2 . . 268
7.8. Temperature variation of recombination coefficient . . 269
7.9. Recombination measurements in high density plasmas . 270
7.10. Recombination of positive and negative ions . . . 270

8. Electron Attachment and Detachment 278
8.1. Negative ions and their electron affinities . . . 278
8.2. The measurement of attachment 281
8.3. Experimental data for attachment to atoms and molecules 288
8.4. Collisional detachment of negative ions 298
8.5. Other negative ion collision processes 302
8.6. Photodetachment 304
8.7. Radiative attachment 309

9. Photon Emission and Absorption 316
9.1. The emission and absorption of radiation . . . 316
9.2. Experimental methods for the study of photoabsorption and photoionization 323
9.3. Photoabsorption and photoionization data . . . 325
9.4. Two-quantum processes 337

10. Elastic Collisions Between Atomic Particles . . . 341
10.1. The elastic scattering of fast ions and fast atoms . . 341
10.2. Experimental studies of fast ion and fast atom elastic scattering 346
10.3. Thermal energy atomic beam scattering 352
10.4. Gas diffusion 357
10.5. The mobility of ions in gases 359
10.6. Theory of ionic mobility; ions in unlike gases . . . 367
10.7. Ion clustering and identification 372
10.8. Theory of ionic mobility: ions in their parent gases . 375

11. Ionization and Excitation by Atomic Particles . . . 382
11.1. Introduction. Ionization at low impact energies . . 382
11.2. Experiments on ionization at higher impact energies. Projectile particle separation 387
11.3. Total charge collection at high energies 390
11.4. Survey of quantum theory calculations 394
11.5. Statistical theory of multiple ionization. The 'transferred energy' 398
11.6. Excitation by fast ions and atoms 406

12. Charge Transfer Processes 413
12.1. Introduction. Theory of symmetrical resonance processes 413
12.2. Charge transfer between unlike ions and atoms; 'The adiabatic theory' 420
12.3. Experimental methods of charge transfer measurement . 427
12.4. 'Accidental resonance' conditions 431

Page

12.5. Resonant electron capture collisions 434
12.6. Behaviour of inelastic ion-atom collision cross-sections at high energies. Ionization with capture 436
12.7. Pseudo-crossing potential energy curves 440
12.8. Radiative charge transfer 444

13. Collisions of Excited Atoms and Molecules 449
13.1. Excitation exchange 449
13.2. Quenching collisions 451
13.3. Line broadening 454
13.4. Classification of collisions of metastable atoms in gases . 456
13.5. Elastic scattering and excitation transfer of metastable atoms 457
13.6. Photon absorption by metastable atoms 460
13.7. Deactivation collisions of metastables with atoms and molecules 461
13.8. Collision-induced radiation 462
13.9. Formation of molecules by collisions of metastables with atoms 463
13.10. Collisions of the second kind between metastables and electrons 464
13.11. Ionization of atoms and molecules by metastables . . 464
13.12. Collision processes of vibrationally and rotationally excited molecules 466

14. Ion-atom Interchange 476
14.1. Introduction 476
14.2. Mass-spectrometer source experiments 476
14.3. Rate constants for ion-atom interchange 483
14.4. Ion-atom interchange experiments at thermal energies . 487

Appendix 494
A1. Some atomic constants and other valuable data . . . 494
A2. First ionization potentials of common atoms 495
A3. First ionization potentials of molecules and radicles . . 495
A4. Some important atomic energy levels 496
A5. Atomic selection rules for electric dipole radiation . . . 498
A6. Simplified diatomic molecular selection rules for electric dipole radiation 499
A7. Wigner-Witmer rules 501
A8. Potential energy curves and dissociation energies of some diatomic molecules and radicles 502
A9. Dipole moments and polarizabilities of some atoms and molecules 506
