Preface	xi
1 The origin of resonance ionisation spectroscopy	1
1.1 Introduction	1
1.2 Excitation and ionisation of gases with charged particles, <i>W</i> values	2
1.3 The Hornbeck–Molnar reactions	5
1.4 Jesse effects	6
1.5 Energy pathways research	8
1.6 Energy pathways in helium	14
1.7 Resonance ionisation spectroscopy	20
References	22
2 RIS studies on He(2¹S)	24
2.1 Introduction	24
2.2 Gaseous electronics	24
2.3 Pulsed ionisation measurements	32
2.4 Concept of the RIS experiment on He(2 ¹ S)	36
2.5 Results of the RIS experiment on He(2 ¹ S) involving photo-ionisation	40
2.6 The RIS experiments on He(2 ¹ S) using associative ionisation	44
References	48
3 One-atom detection	50
3.1 RIS of atoms in their ground states	50
3.2 Sensitive ionisation measurements	58
3.3 A demonstration of one-atom detection	60
3.4 One-atom detection in time coincidence with nuclear decay	67
References	72

4	The interaction of laser light with atoms	74
4.1	Introduction	74
4.2	Review of electromagnetic fields	75
4.3	Interaction of a laser field with isolated atoms	83
4.4	The two-state model	91
4.5	Excitation involving three bound states	102
4.6	A more general adiabatic method	104
4.7	Multiphoton excitation	108
	References	113
5	Theory of resonance ionisation spectroscopy	114
5.1	Introduction	114
5.2	Thermodynamic arguments concerning the absorption and emission of radiation by an atomic vapour	115
5.3	Density matrix formulation of atomic response	118
5.4	Finite band width effects in a two-state model	119
5.5	The incorporation of laser ionisation into the equations of motion	129
5.6	Near-resonant two-photon ionisation	133
5.7	Methods of RIS using commercial lasers	140
5.8	Effective volumes of ionisation	146
	References	149
6	Chemical physics	151
6.1	Introduction	151
6.2	Photodissociation of CsI	151
6.3	Diffusion of caesium atoms in argon gas	156
6.4	Chemical reaction of caesium atoms with O ₂ in the presence of an argon buffer gas	158
6.5	Precision measurements of the diffusion of reactive atoms	160
6.6	Photodissociation of LiI	165
6.7	Chemical reactions of lithium atoms with O ₂	170
6.8	Diffusion of lithium atoms in argon gas	172
6.9	Concluding remarks	174
	References	176
7	Statistical mechanics	178
7.1	Introduction	178
7.2	Density fluctuations in atomic populations	178
7.3	Fluctuations in ionisation by swift particles: the Fano factor	180
7.4	Fluctuations in atomic and molecular processes	188
7.5	The ergodic hypothesis: an Einstein <i>Gedanken</i> experiment	196

7.6	An experimental test of the ergodic hypothesis	199
7.7	Further comments on the ergodic hypothesis	202
	References	203
8	Elemental analyses of solids and related applications of RIS	205
8.1	Introduction	205
8.2	Laser ablation methods LARIS	206
8.3	RIMS using pulsed lasers	209
8.4	RIMS using continuous wave lasers	219
8.5	Atomisation by ion sputtering	223
8.6	Elemental analyses of solids using SIRIS	230
8.7	Comparison of RIS with accelerator mass spectroscopy (AMS)	237
8.8	On-line RIMS in nuclear physics	239
8.9	Some additional applications of RIS	241
	References	242
9	Non-linear optics: applications to resonance ionisation spectroscopy	248
9.1	Introduction	248
9.2	Introduction to non-linear processes	249
9.3	An example of a non-linear process with an unfocused laser beam: third harmonic generation near three-photon resonances in xenon	253
9.4	Third harmonic generation with focused laser beams	264
9.5	Sum mixing with unfocused laser beams	270
9.6	Four-wave sum and difference mixing in Xe and Kr	277
9.7	Two-photon excitation and the stimulated Raman process	279
	References	284
10	Maxwell's demon and other noble concepts	286
10.1	Concept of the Maxwell demon	286
10.2	The atom buncher	289
10.3	Mass spectrometer	295
10.4	Atom bank	297
10.5	Atom counter	304
10.6	A demonstration using ^{81}Kr atoms	306
10.7	A Maxwell demon using time-of-flight principles	310
10.8	RISTRON	311
10.9	Other methods of atom counting	314
10.10	Isotopic enrichment	315
10.11	Concluding remarks	318
	References	319

11	Cosmology and particle physics	323
11.1	Introduction	323
11.2	Connection of cosmology with particle physics	324
11.3	Time evolution of the universe	326
11.4	Standard cosmology and its problems	327
11.5	Inflationary cosmology and magnetic monopoles	329
11.6	Searches for magnetic monopoles	331
11.7	Concept of a monopole detector using RIS	332
	References	338
12	Search for other primordial particles	340
12.1	Introduction	340
12.2	Quark composition of matter and quark confinement	340
12.3	Other predictions of particle physics theories	342
12.4	Searches for fractional charge	345
12.5	RIS searches for fractional charge	347
12.6	Previous searches for stable, heavy, elementary particles	351
12.7	RIS search for heavy elementary particles	354
	References	357
13	Stellar evolution and the solar neutrino mystery	359
13.1	Introduction	359
13.2	Stellar evolution and stellar structure	359
13.3	Energy production in the sun	361
13.4	Solar models and neutrino production	363
13.5	The $^{37}\text{Cl}(\nu, e^-)^{37}\text{Ar}$ solar neutrino experiment	365
13.6	The $^{81}\text{Br}(\nu, e^-)^{81}\text{Kr}$ solar neutrino experiment	370
	References	377
14	Earth and planetary sciences	380
14.1	Introduction	380
14.2	Origin of meteorites and atmospheric xenon	380
14.3	Age of the solar system	385
14.4	Principles of environmental dating	388
14.5	Age of ground-water and polar ice	390
14.6	Ocean water circulation	397
14.7	Concluding remarks	397
	References	398
	Index	401
