

CONTENTS

CHAPTER 1. THREE-BODY RECOMBINATION OF POSITIVE AND NEGATIVE IONS

M. R. FLANNERY

1-1. INTRODUCTION TO IONIC RECOMBINATION	3
1-2. HISTORICAL SURVEY	4
A. The classical theory of Thomson, and related theories	6
B. Quasi-equilibrium and diffusion theories	9
C. Experimental methods	11
1-3. QUASI-EQUILIBRIUM STATISTICAL THEORY AT LOW DENSITIES	13
A. Formula for the three-body recombination coefficient	14
B. Quasi-equilibrium distribution	16
1-4. IONS RECOMBINING IN THEIR PARENT GAS	19
A. Energy-change rate coefficient	20
B. Calculation of the recombination coefficient	25
C. The non-thermal effect	28
1-5. GENERAL THIRD BODY	29
A. General aspects of a collision	29
B. Formula for the rate coefficient	34
C. Reduced parameters and detailed balance	37
D. The rate coefficient for special cases	39
1-6. CALCULATION OF THE RECOMBINATION COEFFICIENT	41
A. Differential scattering cross sections	42
B. Computations	48
C. Partial recombination coefficient	50
D. Quasi-equilibrium distribution function	53
E. Temperature and interaction	55
F. Mass effect	57
1-7. THEORETICAL AND EXPERIMENTAL THREE-BODY IONIC RECOMBINATION COEFFICIENT	62
1-8. SIMPLE TREATMENT OF THREE-BODY IONIC RECOMBINATION	65
A. Recombination as a Markov process	66
1. The Fokker-Planck equation	67
2. Integral equation for the steady-state distribution	67
3. Relationship with the diffusion theory	69

B. Recombination coefficient deduced from the diffusion, effective-gradient and modified effective-gradient methods	70
1. The diffusion method	71
2. The effective-gradient method	73
3. Accuracy of diffusion and effective-gradient methods	75
1-9. THREE-BODY RECOMBINATION AT MODERATE AND HIGH GAS-DENSITIES	77
A. Natanson's theory	78
B. Modification to Natanson's theory	80
C. Comparison with experiment	83
Appendix. THE THOMSON THEORY	85
Acknowledgments	88
References	88

CHAPTER 2. PRECISION MEASUREMENTS OF ELECTRON TRANSPORT COEFFICIENTS

M. T. ELFORD

2-1. INTRODUCTION	94
2-2. THEORY OF ELECTRON SWARMS	95
A. The electron energy distribution function	95
1. When only elastic scattering occurs	97
2. When both elastic and inelastic scattering occurs	97
B. Transport coefficients	98
1. Electron drift velocity	98
2. The diffusion coefficient	99
3. The characteristic energy	100
4. The magnetic deflection coefficient	101
C. The derivation of cross sections from transport coefficients	103
1. When only elastic scattering occurs	103
2. When both elastic and inelastic scattering occur	106
2-3. THE ELECTRON DRIFT VELOCITY	107
A. Review of previous methods of measurement	107
1. Oscillographic methods	107
2. Methods using counters	108
3. Electrical shutter methods	109
B. The Bradbury-Nielson method	111
1. Electrical shutter	111
2. Uniform electric field and geometrical accuracy	112
3. Electron source	114
4. Gas temperature measurement and control	114
5. Gas purity and vacuum requirements	116
6. Pressure measurement	119
7. The determination of the current maxima	119
8. Sources of systematic error	121
9. Correction for the effect of diffusion	124
10. The linear variation of the drift velocity with gas number density	125
C. Experimental data	126
1. Presentation of data	126

2. Analysis of error	129
3. Results and discussion	129
2-4. THE MEASUREMENT OF D_T/μ BY THE TOWNSEND-HUXLEY METHOD	137
A. Introduction	137
1. Historical survey	137
B. The solution of the diffusion equation and the current ratio formula	139
1. The current ratio formula	139
2. Effect of the spatial dependence of the electron energy distribution function	141
C. Experimental method	141
1. Diffusion chamber geometry	141
2. Production of a uniform electric field	142
3. The collector	145
4. The current ratio	146
5. Temperature measurement and control	147
6. Electron source	147
7. Gaseous impurities	147
D. Sources of error	148
1. Nonuniformity of the electric field	148
2. Finite size source hole	150
3. Incorrect axial alignment	150
4. Presence of negative ions	150
E. Experimental results	151
2-5. CONCLUSION	155
Acknowledgements	156
References	156

CHAPTER 3. DIFFERENTIAL CROSS SECTIONS IN ELECTRON IMPACT IONIZATION

H. EHRHARDT, K. H. HESSELBACHER, K. JUNG, K. WILLMANN

3-1. INTRODUCTION	161
3-2. KINEMATICS AND NOTATIONS	162
3-3. DIFFERENT TYPES OF CROSS SECTIONS	163
3-4. CHOICE OF TARGET GAS AND COLLISION VARIABLES	166
3-5. THE APPARATUS	167
A. Description of the electron impact spectrometer	167
B. Detection electronics and measurement procedures	172
C. Intensities	176
D. Background problems	178
E. Stray fields	179
F. Modes of operation	180
G. Normalization problems	182
3-6. EXPERIMENTAL RESULTS	182
A. Double differential cross sections	183
B. The triple differential cross section	188
3-7. COMPARISON WITH THEORY	196

3-8. MEASUREMENTS CLOSE TO THE IONIZATION THRESHOLD	202
Acknowledgement	206
References	206

CHAPTER 4. INTERPRETATION OF SPECTRAL INTENSITIES FROM LABORATORY AND ASTROPHYSICAL PLASMAS

A. H. GABRIEL, CAROLE JORDAN

4-1. INTRODUCTION	211
4-2. THEORETICAL METHODS	212
A. Statistical equilibrium for excited states	212
B. Effects of metastable levels	214
C. Collisional excitation	215
D. Levels above the first ionization limit	219
E. Line ratio measurement of electron temperature	222
F. Line ratio measurement of electron density	223
4-3. COLLISION RATE EXPERIMENTS	224
A. General methods	224
B. Electron beam excitation	225
C. Laboratory plasma experiments	225
D. Théta-pinches	227
4-4. LITHIUM-LIKE IONS	229
A. General description	229
B. Energy levels	231
C. Transition probabilities	231
D. Collisional excitation rates	232
E. Statistical equilibrium	234
F. Line intensities in laboratory sources	235
G. Solar line intensities	237
H. Dielectronic satellite lines	241
4-5. BERYLLIUM-LIKE IONS	242
A. General description	242
B. Energy levels	243
C. Transition probabilities	244
D. Collisional excitation rates	244
E. Equations of statistical equilibrium	249
F. Laboratory plasmas	252
G. Solar line intensities	255
H. Low density objects, quasars, and planetary nebulae	264
I. Recent developments	265
4-6. HELIUM-LIKE IONS	265
A. General description	265
B. Energy levels	267
C. Transition probabilities	268
D. Collisional excitation rates	270
E. Low density plasmas	274
F. High density plasmas	277
G. Intermediate densities	281

H. Line ratios, N_e and T_e	283
I. Dielectronic satellite lines	286
J. Absolute intensities	286
K. Recent developments	287
Acknowledgements	288
References	288

CHAPTER 5. ATOMIC PROCESSES IN ASTROPHYSICAL PLASMAS

VALERIE P. MYERSCOUGH, G. PEACH

5-1. INTRODUCTION	295
5-2. STELLAR ATMOSPHERES	296
A. General theory of radiative transfer	296
B. The construction of model atmospheres	300
C. Line radiation	303
D. Departures from local thermodynamic equilibrium	305
5-3. THE CONTINUOUS SPECTRUM.	312
A. General formulae	312
B. Absorption by neutral atoms and positive ions	316
C. Photodetachment of negative ions	322
D. Coherent scattering	328
5-4. THE LINE SPECTRUM	329
A. Transition probabilities	329
B. The line profiles – general formulae	333
C. Pressure broadening of spectral lines	336
5-5. COLLISIONAL EXCITATION AND IONIZATION.	354
A. The quantum mechanical theory – general formulae and approximations	354
B. Classical and semi-classical approximations	361
5-6. INTERPRETATION OF OBSERVATIONS	366
A. Curve of growth analysis	366
B. The solar atmosphere	368
C. The early-type stars and planetary nebulae	373
D. The late-type stars; molecular absorption.	379
E. Stars of non-solar composition.	381
1. Weak helium line stars	381
2. Hydrogen deficient stars	383
3. Carbon stars	384
5-7. PROBLEMS REQUIRING FURTHER STUDY.	387
Acknowledgments	389
References	389

CHAPTER 6. POLARIZED ORBITAL APPROXIMATIONS

R. J. DRACHMAN, A. TEMKIN

6-1. INTRODUCTION	401
6-2. THE BASIC METHOD AND NOTATION	402

6-3. THE POLARIZED TARGET WAVE FUNCTION	404
A. The adiabatic approximation	404
B. Perturbation theory	405
C. The one-electron target	406
D. Variational-perturbation methods	414
E. The exact static solution for the one-electron target	417
F. The many-electron target; Sternheimer's approximation	421
6-4. THE TOTAL POLARIZED ORBITAL WAVE FUNCTION AND THE SCATTERING PROBLEM	423
A. Introductory remarks	423
B. The total wave function and non-variational methods	424
C. Variational and variationally motivated methods	426
6-5. APPLICATIONS TO ELECTRON SCATTERING AND REACTIONS	433
A. Scattering from one-electron targets	433
1. Elastic scattering	433
2. Inelastic scattering	440
B. Scattering from helium	445
C. Scattering from other (non-highly polarizable) atoms	448
D. Scattering from highly polarizable atomic systems	451
E. Electron-molecule scattering	454
F. Photoionization, autoionization and ionization	456
6-6. APPLICATION TO POSITRON SCATTERING AND ANNIHILATION	462
A. Positron-hydrogen scattering	463
B. Positron-helium scattering and annihilation	469
References	477

CHAPTER 7. PHOTODETACHMENT: CROSS SECTIONS AND ELECTRON AFFINITIES

B. STEINER

7-1. INTRODUCTION	485
7-2. PHOTODETACHMENT CROSS SECTIONS	487
A. Introduction	487
B. Theory	490
C. Experiment	491
D. Double photon detachment	492
7-3. PHOTODETACHMENT THRESHOLDS	493
A. Experimental energy determination	493
B. Threshold behavior theory	494
1. Atoms	494
2. Molecules	495
C. Comparison of experiment with theory	496
7-4. EXPERIMENTAL APPROACHES	497
A. Plasma	497
B. Beams	498
1. Introduction	498

2. Classical experimental approach	498
a. Negative ion sources	498
b. Initial ion focusing	502
c. Mass analysis	502
d. Final ion focusing	504
e. Ion monitoring	504
f. Electron monitoring	505
g. Photon optics	511
h. Beam overlap	512
i. Instrument alignment	514
3. Detachment using tunable dye laser	514
4. Detachment using fixed laser and electron energy analysis	515
5. Double quantum detachment	517
7-5. ELECTRON AFFINITIES	517
A. Techniques	517
1. Theory	517
2. Empirical fitting	518
a. Ionization energy	519
b. First excitation energy	519
c. Binding energy per p electron	519
d. Configuration energy	519
e. Electron affinity horizontal analysis	520
f. Radius-vertical analysis	520
g. Correlation energy	520
3. Experiment	520
a. Photodetachment and radiative attachment	521
b. Photoionization	521
c. Dissociative electron attachment	522
d. Thermochemistry	523
e. Born-Haber cycle	525
f. Charge exchange	525
g. Solid spectroscopy	525
h. Field detachment	526
i. Electron scattering	526
B. Case study: S^-	526
C. A selected list of electron affinities	528
Acknowledgment	539
References	539

CHAPTER 8. THE ROLE OF METASTABLE PARTICLES IN COLLISION PROCESSES

R. D. RUNDEL, R. F. STEBBINGS

8-1. INTRODUCTION	549
8-2. PRODUCTION OF METASTABLES	551
A. Thermal metastables	551
1. Recoil effects	552
2. Production cross sections	555
B. Fast metastables	559

8-3. DETECTION AND IDENTIFICATION	561
A. Collisions with surfaces	561
B. Collisions with gas atoms or molecules	568
C. Collisions with photons	569
D. Collisions with electrons	570
E. Interaction with d.c. electric and magnetic fields.	571
F. Magnetic resonance techniques.	572
8-4. CHEMIIONIZATION.	574
A. General principles of thermal energy metastable collision experiments	576
B. Absolute measurements.	577
1. The afterglow technique.	578
2. The beam technique.	583
3. Results.	588
C. Measurements of singlet-triplet cross section ratios.	593
D. Models of chemiionization reactions.	596
E. Theoretical treatments of chemiionization.	608
F. Chemiionization involving highly excited atoms.	612
8-5. ION BEAM STUDIES	613
References	624
