26. COLLISIONS OF SLOW POSITRONS AND OF SLOW POSITIVE MUONS IN GASES

1. Introduction	3123
2. The annihilation of free positrons	3124
3. Positronium	3125
4. The life-history of a positron in a gas	3127
4.1. Positronium formation in the Öre gap	3127
4.2. Processes leading to quenching of ortho-positronium	3129
5. Experimental methods for investigating slow collisions of positrons and of positronium in gases	3130
5.1. The measurement of delayed coincidence annihilation spectra	3133
5.1.1. Analysis of annihilation-time spectra	3134
5.2. Measurement of orthoPs concentrations by gamma ray methods	3137
5.2.1. From the energy spectrum of single annihilation quanta	3137
5.2.2. From observation of triple coincidences	3142
5.3. Angular correlation measurements	3145
6. Effect of magnetic fields on positronium formation	3148
7. The effect of electric fields on positron annihilation rates and on positronium formation	3155
7.1. The effect on the positron annihilation rate	3155
7.2. The effect on positronium formation	3156
7.3. Experimental observation of the effects on positronium forma- tion	3161
7.4. Summary	3165
8. Summary of experimental possibilities for studying reactions of positrons and of positronium in gases	3166
9. Some historical notes	3168
10. The theory of the collisions of slow positrons with atoms	3169
10.1. Introduction	3169
10.2. Collisions with hydrogen atoms	3171
10.2.1. The zero-order phase shift	3171
10.2.2. The higher order phase shifts	3178
10.2.3. Summarizing remarks	3180

10.3. Collisions with helium atoms	3181
10.3.1. The zero-order phase shift	3182
10.3.2. The higher order phase shifts	3183
10.3.3. The momentum-transfer cross-section	3183
10.3.4. The effective number Z_a of annihilation electrons	3186
10.3.5. The angular correlation between two-photon annihilation quanta	3186
10.4. Collisions with neon and argon atoms	3187
10.5. Theoretical evaluation of cross-sections above the Ps formation threshold	3190
11. Analysis and discussion of experimental results on delayed annihilation of free positrons in gases	3191
11.1. Helium	3191
11.2. Argon and neon	3202
11.3. Other gases	3209
12. The theory of the collisions of slow Ps atoms with other atoms	3213
12.1. Introduction	3213
12.2. Collisions with hydrogen atoms—exchange quenching	3213
12.3. Collisions with helium atoms—pick-off quenching	3215
13. Discussion of experimental results on the quenching of orthoPs atoms in gases	3218
13.1. Results at room temperature	3218
13.2. Results at low temperatures—bubble formation	3220
14. Positronium chemistry	3227
15. The passage of positive muons through matter and muonium formation	3230
15.1. Introductory	3230
15.2. Muonium	3231
15.2.1. Energy levels and fine structure splitting of muonium	3231
15.2.2. Hyperfine splitting of muonium	3231
15.3. Magnetic moment of muonium	3233
15.4. Depolarization of muons by muonium formation	3233
15.5. Muonium formation in presence of longitudinal magnetic field	3235
16. Direct experimental identification of muonium formation in gases	3236
16.1. Direct observation of muonium precession frequency	3236
16.2. Observation of micro-wave resonance spectrum of muonium	3238
16.2.1. Observation at high magnetic fields	3240
16.2.2. Observation at low magnetic fields	3242
16.2.3. Pressure shift in the micro-wave resonance spectrum	3244

CONTENTS

xv

17. Muonium formation in condensed materials	3248
17.1. Direct evidence for muonium formation in condensed materials	3248
17.2. Indirect evidence of muonium production from the study of the spin depolarization of μ^+ stopped in various materials	3253
17.3. Measurement of μ^+ polarization in a longitudinal magnetic field	3253
17.4. Measurement of μ^+ polarization in a transverse magnetic field	3255
17.5. Results of muon depolarization measurements	3255
17.6. Measurement of spin relaxation time for μ^+ stopping in a condensed medium	3255
17.7. Interpretation of the observations on muon spin depolarization	3259
17.8. Physical processes involved in μ^+ depolarization	3262
18. Measurement of electron spin-exchange cross-sections for muonium	3264
18.1. Effect of impurities on the micro-wave resonance spectrum of muonium	3264
18.2. Effect of impurities on μ^+ spin relaxation time in argon	3266
19. Muonium chemistry	3269

27. COLLISION PROCESSES INVOLVING MESIC ATOMS

1. Introduction	3276
2. Processes leading to mesic atom formation	3276
2.1. Energy loss of fast negatively-charged particles	3277
2.2. Capture of negative mesons	3278
2.2.1. Capture of negative mesons by atomic hydrogen	3279
2.2.2. Capture of negative mesons in molecular hydrogen	3284
2.2.3. Capture of negative mesons by atoms other than hydrogen	3286
2.2.4. Depolarization of negative muons in the capture process	3289
3. De-excitation processes of mesic atoms	3290
3.1. De-excitation of mesic hydrogen (Me^-p)	3290
3.2. Measurement of the de-excitation time of mesic hydrogen atoms	3294
3.3. The de-excitation time of mesic atoms in liquid helium	3298
3.4. De-excitation of heavier mesic atoms	3299
3.5. The polarization of muons decaying at rest	3300
3.6. Exchange collisions of (μ^-p) in hydrogen	3304
4. Cross-sections and collision rates of (μ^-p) and (μ^-d) atoms obtained from the muon-catalysed fusion process, and related phenomena	3306
4.1. The observation of muon-catalysed fusion	3306

CONTENTS

4.2. Experimental study of the process	3308
4.2.1. The bubble chamber method	3308
4.2.2. The diffusion chamber method	3310
4.2.3. Study of γ -ray emission in muon-catalysed fusion	3312
4.3. Derivation of cross-sections for basic processes important in muon-catalysed fusion	3312
4.3.1. Description of the basic processes	3312
4.3.2. The yield of γ -rays and re-emitted muons	3314
4.3.3. Time distribution of γ -ray emission	3315
4.3.4. Influence of hyperfine structure effects on fusion rates	3318
4.3.5. Influence of muon recycling and trapping on fusion rate	3321
4.4. Impurity method of studying rates for collision processes of (μ^-p) and (μ^-d) atoms	3323
4.4.1. Rates for muon transfer and muonic molecule formation	3323
4.4.2. Transfer rate of negative pions from gaseous hydrogen to argon	3328
4.4.3. Scattering cross-sections of (μ^-p) and (μ^-d) atoms	3330
5. Theory of muonic atom collision processes	3336
5.1. The general theory	3336
5.2. States of muonic molecules	3339
5.3. Collisions of (μ^-p) and (μ^-d) in hydrogen and deuterium	3339
5.3.1. Scattering phases and cross-sections	3343
5.3.2. Hyperfine effects in (μ^-p) and (μ^-d) scattering	3345
5.3.3. Transfer of μ^- from hydrogen to heavier elements	3347
5.4. Formation of muonic molecules	3349
5.5. Nuclear fusion rate in muonic molecules	3351
