

Table of Contents

1.	Introduction	1
2.	Classical theory of HI collisions	3
2.I.	Elastic scattering	3
2.1	Classical deflection function and cross-section	3
2.2	Heavy-ion interaction potentials	7
2.3	Rainbow, glory, and spiral scattering	12
2.3.1	Rainbow scattering	12
2.3.2	Glory scattering	13
2.3.3	Spiral scattering (orbiting)	14
2.3.4	Application to elastic heavy-ion scattering	14
2.4	Limitations due to quantal effects and absorption	16
2.4.1	Limitations due to quantal effects	16
2.4.2	Limitations due to absorption	21
2.II.	Deeply inelastic collisions	22
2.5	Experimental situation	22
2.6	Phenomenological description. Friction	27
2.7	Microscopic derivations of frictional forces	29
2.8	Numerical calculations	31
2.9	Experimental cross-sections and deflection functions	37
2.10	Limitations due to fluctuations	39
	References to chapter 2	40
3.	Gross properties of HI reactions. Compound-nucleus formation	42
3.I.	Properties of reaction channels. Qualitative features of cross-sections	42
3.1	Channels, Q-values	42
3.2	Q-values at contact. Energy release in forming the compound nucleus	43
3.3	Grazing collisions and reaction cross-sections	47
3.4	Qualitative decomposition of the total cross-section	51

3.5	Critical angular momentum and instability against prompt fission	54
3.6	Prompt fission and compound-nucleus formation	59
3.II.	Level densities and the compound nucleus	61
3.7	Nuclear level densities	61
3.8	Yrast levels	65
3.9	Yrast levels and compound-nucleus formation	69
3.10	Experimental results on compound-nucleus formation.	
	Entrance channel effects	70
	References to chapter 3	78
4.	Some elements of nuclear scattering theory	80
4.1	Elastic scattering	80
4.2	Inelastic processes	86
	References to chapter 4	88
5.	Elastic scattering	89
5.1	Semiclassical theory of elastic scattering	89
5.1.1	Derivation of the semiclassical scattering amplitude	90
5.1.2	Rainbow, glory, and spiral scattering	96
5.1.3	Application and generalization of the semiclassical approximation	99
5.2	Optical model for elastic scattering	105
5.2.1	Parameters of the optical-model potential and redundancies	105
5.2.2	The elastic scattering of $^{16}\text{O} + ^{16}\text{O}$	108
5.3	Sharp cut-off diffraction model	114
5.3.1	Qualitative considerations	115
5.3.2	Review of Fresnel diffraction	116
5.3.3	Coulomb scattering and Fresnel diffraction	119
5.3.4	Frahn's diffraction diagram	124
5.3.5	Frahn's derivation of Fresnel diffraction from the strong absorption model	128

5.3.6	Rainbow refraction versus Fresnel diffraction	130
5.4	Smooth cut-off model	131
5.4.1	General treatment of the smooth cut-off model	133
5.4.2	Strong absorption model	134
5.5	Regge poles	137
5.5.1	Definition and properties of Regge poles	137
5.5.2	Diffraction model and Regge poles	144
5.5.3	Identification of Regge poles	144
5.5.4	Dynamical interpretation of Regge poles	146
	References to chapter 5	149
6.	Coulomb excitation	152
6.1	Qualitative considerations	152
6.2	First-order perturbation theory	155
6.2.1	Electric excitation	156
6.2.2	Discussion	158
6.2.3	Symmetrization of cross-sections	162
6.2.4	Survey of the approximations	162
6.3	Higher-order effects	163
6.3.1	The coupled equations	164
6.3.2	The reorientation effect	165
6.3.3	Double E2 excitation	167
6.3.4	Electric dipole polarization	168
6.3.5	Illustrative picture of the mechanism of multiple Coulomb excitation	169
6.4	Quantum-mechanical corrections	171
6.4.1	The coupled equations	171
6.4.2	Discussion of the quantum-mechanical corrections	173
6.5	Methods of detecting Coulomb excitation	175
6.5.1	Direct measurement of the spectrum of scattered particles	175
6.5.2	Detection of deexcitation gamma rays	176
	References to chapter 6	177

7.	Inelastic scattering and transfer reactions	178
7.1	Classical considerations	178
7.2	Semiclassical description	182
7.3	Coupled channels and DWBA	190
7.3.1	Coupled channels for inelastic scattering	190
7.3.2	Optical potential in the coupled-channels formalism	192
7.3.3	Distorted wave Born approximation (DWBA)	195
7.3.4	Alpha particle scattering from deformed nuclei	196
7.3.5	Generalization of the coupled-channels formalism to transfer reactions	199
7.3.6	Elastic transfer	203
7.3.7	DWBA and recoil effects	214
7.4	Parametrized phase-shift model in the DWBA for inelastic and transfer reactions (Smooth cut-off model and Regge-pole model)	216
7.4.1	Smooth cut-off model	217
7.4.2	Regge-pole model	218
	References to chapter 7	220
8.	Statistical theory	223
8.1	The statistical model	224
8.2	Precompound decay	232
8.2.1	Experimental results	234
8.2.2	Pre-equilibrium models	234
8.3	Theoretical foundations	243
8.4	Transport theory of deeply inelastic collisions	244
	References to chapter 8	250
9.	Atomic effects in ion-atom collisions	252
9.1	Production of inner-shell vacancies	253
9.2	Molecular X-rays from quasi-atoms	256
9.3	Interior electron shells in super-heavy atoms	260
9.4	Production of positrons in overcritical fields	261

References to chapter 9	266
Subject index	269
