

INDICE

CH. SCHLIER - Preface	pag. xiii
CH. SCHLIER - Introduction	» xiv
Gruppo fotografico dei partecipanti al Corso	fuori testo

D. BECK - Collision mechanics.

1. Definition of the collision cross-section in the laboratory system (LS)	pag.	1
2. Cross-section in the center-of-mass system (CMS)	»	3
3. CMS-LS conversion	»	5
3'1. Differential partial cross-section	»	5
3'2. Integral partial cross-section	»	6
3'3. Differential, partially summed cross-section.	»	6
4. Examples	»	7
4'1. Differential elastic-scattering cross-section from a crossed molecular beam experiment	»	7
4'2. Integral elastic-collision cross-section from a beam experiment	»	8
4'3. Transport properties.	»	9
5. Classical calculation of the elastic-scattering cross-section	»	9
5'1. Hard spheres	»	11
5'2. Interatomic potential	»	11

D. BECK - Elastic scattering of nonreactive atomic systems.

1. Elastic scattering and the atomic interaction	»	15
2. Formal solutions and validity of approximate methods	»	18
2'1. Born's approximation	»	19
2'2. JWKB approximation	»	20
2'3. Classical approximation	»	21
2'4. High-energy approximation	»	21

3.	The JWKB approximation	pag.	24
3'1.	The JWKB phase shift	»	24
3'2.	The Rosen-Yennie phase shift	»	27
3'3.	The Jeffreys-Born phase shift	»	27
4.	The semiclassical approximation	»	29
4'1.	Basic idea	»	29
4'2.	Implications	»	31
4'3.	Rainbow scattering	»	33
4'4.	Integral cross-section	»	35
5.	Experimental results and extraction of potential information	»	38
5'1.	Total cross-sections	»	39
5'2.	Rainbow scattering	»	43
5'3.	Rapid oscillation pattern	»	46

R. J. CROSS jr. - Vibrationally and rotationally inelastic scattering.

1.	Introduction	»	50
2.	Formal theory of inelastic scattering	»	50
3.	Approximate methods	»	53
3'1.	Numerical methods	»	53
3'2.	Integral equations	»	53
3'3.	Distorted-wave approximation	»	54
3'4.	Born approximation	»	54
3'5.	Infinite-order distorted-wave approximation	»	55
3'6.	The semi-classical approximation	»	55
3'7.	Diagonalization of the S-matrix	»	56
3'8.	Effect of anisotropy on total scattering measurements	»	58
3'9.	Vibrationally inelastic scattering	»	58
4.	Experimental	»	59
4'1.	Spectroscopic methods	»	59
4'2.	Relaxation methods	»	60
4'3.	Beam methods	»	60
4'4.	Some general results	»	60

H. GG. WAGNER - Relaxation methods.

1.	Introduction	»	62
2.	Experimental methods (group I)	»	64
2'1.	Sound dispersion and absorption	»	65
2'2.	Shock waves	»	67
2'3.	Other methods	»	69
3.	Experimental methods (group II)	»	69
4.	Some results	»	72
5.	Theoretical considerations	»	73

D. R. HERSCHBACH - Reactive collisions of thermal neutral systems.	
Part A - <i>Kinematics</i>	pag. 77
1. The conservation of energy	» 78
2. The conservation of linear momentum	» 78
3. The conservation of intensity	» 79
Part B - <i>Bibliography of reactive beam scattering</i>	» 80
J. Ross and E. F. GREENE - Elastic scattering of reactive systems.	
1. Optical model	» 86
2. Measurements.	» 91
3. Interpretation	» 99
3'1. Potential parameters	» 99
3'2. Probability of reaction and threshold conditions	» 99
3'3. Total reaction cross-section	» 106
4. Conclusions.	» 106
F. S. ROWLAND - Hot-atom chemistry. - I	
1. The nature of hot-atom chemistry	» 108
2. Hot-atom techniques. Nuclear recoil, radio gas chromatography	» 109
3. Types of hot-atom reaction	» 112
4. Other techniques for hot-atom chemistry: photochemistry, beams	» 114
5. Chemical reaction range	» 116
F. S. ROWLAND - Hot atom chemistry. - II	
1. Unimolecular reactions	» 127
2. Secondary reactions of excited products from recoil substitution reactions	» 128
3. Is energy always randomized prior to reaction?	» 135
A. HENGLEIN - Kinematics of ion-molecule reactions.	
1. Introduction	» 139
2. Conventional studies of ion-molecule reactions	» 141
2'1. Experimental procedures.	» 141
2'2. Various types of reactions of positive ions	» 144
2'3. Reactions of excited ions	» 145
2'4. Statistical complexes in ion-molecule reactions	» 146
2'5. Sticky collision complexes	» 147

3.	The polarization theory	pag. 148
3'1.	Cross-section for close collisions	» 148
3'2.	Discussion and limitations of the polarization theory	» 153
4.	The spectator stripping model	» 154
4'1.	Velocity spectra of H atom transfer reactions	» 154
4'2.	Isotope effects and heavy spectator groups	» 158
4'3.	Angular distribution of product ions	» 159
4'4.	Energy considerations	» 162
5.	Modifications of the stripping model	» 165
5'1.	Derivations from spectator stripping at high energies	» 165
5'2.	Recoil stripping	» 167
5'3.	Impulse approximation at high energies	» 168
5'4.	Deviations at low energies	» 170
6.	Complex → stripping transitions	» 174
6'1.	The reaction $\text{CH}_4^+ + \text{CH}_4 \rightarrow \text{CH}_5^+ + \text{CH}_3$	» 174
6'2.	Reactions of the type $\text{X}^+ + \text{CD}_4 \rightarrow \text{XD}^+ + \text{CD}_3$	» 175
6'3.	Reactions of the methanol ion. Kinematics of an endothermic process	» 176
6'4.	Internal-energy relaxation during a chemical reaction	» 178
7.	Comparisons with crossed molecular beam studies	» 180
 G. G. VOLPI – Gas-phase proton-transfer reactions.		
1.	Introduction	» 184
2.	The apparatus. H_3^+ as a proton donor	» 185
3.	Proton transfer rates and mechanisms	» 187
4.	Proton capture	» 189
5.	Bond fission	» 190
 R. S. BERRY – Chemiionization.		
I.	- <i>Chemiionization processes and experimental information</i>	» 193
1.	Introduction and classification	» 193
2.	Autoionization	» 195
3.	Associative ionization, Penning ionization, collisional ionization and dissociative recombination	» 199
3'1.	Dissociative recombination	» 200
3'2.	Associative and Penning ionization	» 201
3'3.	Ionization in thermal dissociation	» 207
II.	- <i>Interpretation and theory</i>	» 208
1.	A summary of observation	» 209
2.	Interpretation in terms of potential curves	» 209
2'1.	» 209
2'2.	Potential curve arguments for associative, collisional and Penning ionization	» 212

3. Quantitative theories	pag.	217
3'1. The Demkov-Komarov theory	»	217
3'2. Weak interaction theories	»	218
3'3. Close-coupled near-adiabatic theories	»	221
R. S. BERRY - Transfer of electronic excitation.		
1. A survey of some systems	»	229
2. Theories of electronic-energy transfer	»	234
2'1. General rules	»	235
2'2. Microscopic theories	»	236
J. ROSS - Nonequilibrium effects in chemical kinetics.		
1. Microscopic reversibility	»	249
2. Boltzmann equation	»	250
3. Chapman-Enskog solution of the Boltzmann equation	»	252
4. Discussion	»	255
H. GG. WAGNER - Rate constants and reaction cross-sections » 258		
F. S. ROWLAND - Thermal chemical reactions and transition-state theory.		
1. Thermal chemical reactions	»	267
2. Transition states and reaction mechanisms	»	270
3. Calculation of reaction rates	»	272
4. Isotope effects on the rates of chemical reactions	»	274
5. Quantitative kinematic calculations	»	277
H. GG. WAGNER - The measurement of rate constants » 279		
1. Methods for measuring rate constants	»	283
2. Methods for measurements of concentrations	»	283
3. Reacting species	»	284
4. Some examples	»	285
4'1. Reaction of N ₂ O	»	285
4'2. Reaction of O atoms with COS	»	287
4'3. The reaction CH ₄ +OH → CH ₃ +H ₂ O	»	289
4'4. Reaction of O with C ₂ H ₂	»	290

F. S. ROWLAND - Experiments on the H₃ system.

1. Introduction	pag. 293
2. Experiments in thermal systems	» 294
3. Photochemical hot experiments.	» 295
4. Experiments with recoil tritium atoms	» 299

F. S. ROWLAND - Experiments on unimolecular reactions.

1. Introduction	» 303
2. RRKM theory	» 304
3. Molecular lifetimes	» 305
4. Chemical activation experiments	» 307
5. Chemical activation with methylene	» 310

D. L. BUNKER - Unimolecular reactions: Theory » 315

M. KARPLUS - Potential-energy surfaces.

1. Introduction	» 320
1'1. Statement of the problem	» 320
2. Outline of computational methods	» 322
2'1. Special methods for simple systems.	» 324
2'2. Extension to many-electron systems	» 325
2'3. Integrals in polyatomic calculations	» 329
2'4. Semi-theoretical calculations	» 332
3. Illustrative examples	» 339
3'1. The H ₃ potential surface	» 339
3'2. The H ₄ potential surface	» 343
3'3. The H, Li, F potential surfaces.	» 343

H. CONROY - Special results in potential-energy surfaces.

1. One-electron wave function	» 349
2. Polyelectronic wave functions	» 350
3. Optimization of the wave function	» 350
4. Evaluation of integrals	» 351
5. Some results	» 351

D. L. BUNKER - Trajectory studies.

1. The technology of the method	» 355
1'1. The potential energy	» 355
1'2. The classical trajectories.	» 358
1'3. Selecting the initial conditions	» 362

2. Results for artificial reactions	pag. 364
2'1. The character of the motion.	» 364
2'2. The collision parameters.	» 364
2'3. The masses and the potential	» 365
2'4. The dimensionality	» 367
3. Results corresponding to real reactions	» 367
3'1. Hydrogen and chlorine	» 367
3'2. Alkali atoms and alkyl iodide	» 368
3'3. Potassium and hydrogen bromide	» 369
3'4. Potassium and bromine	» 369
3'5. Tritium and methane	» 370
 M. KARPLUS – Special results of trajectory studies.	
1. Introduction	» 372
2. Total reaction probability and cross-section	» 373
3. Rate constants and transition-state theory	» 376
4. Significant energies	» 378
5. Transition-state theory	» 379
6. Details of reaction mechanism	» 382
7. Transition configuration	» 384
8. Low- and high-energy mechanism	» 385
9. Differential cross-section	» 386
 J. ROSS – Quantum theory of reactive scattering.	
1. Green's function	» 392
2. The transition matrix	» 394
3. Two-potential scattering without rearrangement	» 396
4. Rearrangement collisions.	» 398
5. Faddeev equation for three particles	» 400
6. Complex formation	» 402
 M. KARPLUS – Special results of theory: Distorted waves.	
1. Introduction	» 407
2. Formulation	» 407
3. Construction of two-body potential	» 410
4. Elastic scattering	» 418
5. Reactive scattering	» 422
 D. L. BUNKER – Special results of theory: Compound-state approaches	
	» 427
Subject index	» 433
