CONTENTS

CHAPTER I

Elementary physical processes in atom and ion sources

1.1 Excitation of atoms and molecules 11
1.1.1 Excitation of atoms and molecules by electron impact 11
1.1.2 Excitation by atom or ion impact 22
1.1.3 Excitation by light quanta 24
1.2 Ionization of atoms and molecules 25
1.2.1 Ionization of atoms or molecules by electron impact 25
1.2.2 Ionization of atoms or molecules by atom or ion impact 37
1.2.3 Ionization of atoms and ions by light quanta 41
1.2.4 Autoionization 44
1.2.5 Surface ionization 46
1.3 Negative ions 52
1.4 Charge transfer 56
1.5 Recombination 64
1.6 Dissociation 72
1.7 Diffusion and mobility of ions and electrons 76
1.8 Secondary electron emission 79

CHAPTER II

Atom sources

2.1 Introduction 84
2.2 Extraction and collimation of atom beams 85
2.2.1 Effusion atom beam 85
2.2.1.1 Effusion across long channels 87
2.2.1.2 Effusion through multi-collimator 89
2.2.2 Supersonic atom beams 90
2.2.3 Velocity distribution of atomic beams 96
2.3 Atomic gas sources 99
2.4 Thermal atom sources 100
2.4.1 Atom sources of high melting elements 106
2.5 Molecular dissociation 110
2.5.1 Thermal dissociators 110
2.5.2 Low frequency dissociators (Wood-tube) 113
2.5.3 High frequency dissociators 114
2.5.4 Arc- discharge dissociators 118

2.6 Fast atom beam sources 119
2.6.1 Sources of atom or molecular beams with energies from 0.5 to 20 eV 119
2.6.2 Sources of atom beams with energies in the range 10 to 10^6 eV 121

CHAPTER III

Ion sources

3.1 Introduction 127
3.2 Electron impact ion source 128
3.3 Surface ionization ion sources 134
3.4 Gas discharge ion sources 140
3.4.1 Townsend-type gas discharge 141
3.4.2 Glow discharge 146
3.4.3 Arc-discharge at low gas pressure 148
3.4.4 High frequency gas discharges 153
3.4.4.1 Alternating electric field or linear high frequency discharge 154
3.4.4.2 Alternating magnetic field or ring high frequency discharge 157
3.4.5 Effect of static magnetic fields on gas discharges 158
3.5 High voltage arc-discharge ion sources 161
3.6 Low voltage arc-discharge ion sources 162
3.7 Arc-discharge ion sources in magnetic field 168
3.7.1 Arc-discharge ion sources in magnetic field with heated cathode 169
3.7.1.1 The heated cathode arc-discharge ion sources with homogeneous magnetic field 169
3.7.1.2 Hot cathode arc-discharge ion sources in an inhomogeneous magnetic field 170
3.7.2 Arc-discharge ion sources with heated cathode and oscillating electrons in magnetic field 176
3.7.2.1 Ion sources with oscillating electrons in a homogeneous magnetic field 177
3.7.2.2 Ion source with hot cathode and oscillating electrons in an inhomogeneous magnetic field 181
3.7.3 Cold cathode arc-discharge ion sources with oscillating electrons in magnetic field 183
3.7.3.1 Cold cathode Penning-type ion sources with axial ion-extraction 185
3.7.3.2 Cold cathode Penning-type ion source with transversal ion extraction 189
3.8 High frequency gas discharge ion sources 191
3.8.1 High frequency ion sources with probe extracting system 193
3.8.2 High frequency ion sources with diaphragm-type extracting system 202
3.9 Ion sources ionizing solid state elements 209
3.9.1 Ion sources with evaporator mounted outside of the ionizer 210
3.9.2 Ion sources with evaporator inside the ionizer chamber 221
3.9.3 Ion sources with metal evaporation by electron bombardment 224
3.9.4 Ion source with metal vapour sputtered from the cathode due to ion bombardment 225

CHAPTER IV

Special ion sources

4.1 Negative ion sources 231
4.1.1 Ion sources with direct extraction of negative ions 231
4.1.2 Negative ion sources utilizing charge transfer 233
4.1.2.1 Negative ion sources with long extracting channel 234
4.1.2.2 Negative ion sources with separate charge transfer target 236
4.1.3 Negative ion sources utilizing surface ionization 244
4.2 Production of multiply charged ions 244
4.2.1 Production of multiply charged ions in ion sources 244
4.2.2 Production of multiply charged ions by electron stripping 251
4.3 Sources of pulsed ion beams 254
4.3.1 Ion sources for the production of ion current pulses of longer than microsecond duration 255
4.3.2 Methods for the production of nanosecond ion current pulses 258
4.3.2.1 Pulsing by oscilloscopic method 258
4.3.2.2 Pulsation by bunching method 261
4.3.2.3 Bunching of reaction products formed in the target 270
4.3.3 Systems for the production of nanosecond ion current pulses 273
4.3.3.1 Systems bunching by velocity modulation 274
4.3.3.2 Systems bunching by magnetic compression 278
4.3.3.3 Systems bunching by travelling wave 279
4.4 Nuclear spin-polarized ion sources 281
4.4.1 Introduction 281
4.4.2 The hyperfine structure of energy levels in hydrogen atoms 282
4.4.3 Separation of atomic components of an atomic beam in different spin states 288
4.4.4 Nuclear spin polarization of hydrogen atom beams excited to $2S_{1/2}$ state 295
4.4.5 Nuclear spin polarization of atoms by optical pumping 297
4.4.6 Nuclear spin polarization by polarized electron capture 298
4.4.7 Nuclear spin polarized ion beam sources 299
4.4.7.1 Polarized ion sources using inhomogeneous magnetic field for separation 299
4.4.7.2 Polarized ion sources using the Lamb shift of the $2S_{1/2}$ metastable level 306
4.4.7.3 Polarized ion sources using optical pumping 313

CHAPTER V

Distribution of charges and masses in ion beams

5.1 Introduction 315
5.2 Relative concentrations of the different ions in hydrogen ion sources 315
5.3 Mass distribution of hydrogen ion beams extracted from different types of ion sources 317
5.3.1 Mass spectrum of ion beams from capillary arc-discharge ion sources 318
5.3.2 Mass spectrum of the ion beam extracted from a duoplasmatron 319
5.3.3 Mass spectrum of ion beams extracted from ion sources with oscillating electrons 320
5.3.4 Mass spectrum of ion beams extracted from high frequency gas discharge ion sources 322

5.4 Charge distribution of multiply charged ion beams extracted from ion sources 324
5.5 Experimental apparatus for mass distribution analysis of ion beams 327
5.6 Energy spread of ions emitted from ion sources 329
5.7 Experimental apparatus for measuring the spread of ion energy in ion beams extracted from ion sources 337

CHAPTER VI

Extraction of ions from ion sources and forming of the extracted beam

6.1 Extraction of ions formed in the ion sources 340
6.2 Ion-optical properties of the extracting systems 342
6.2.1 Ion-optical properties of probe-type extracting systems 343
6.2.2 Ion-optical properties of diaphragm-type extracting systems 347
6.2.3 Ion-optical properties of the plasma surface ballooned out from the discharge volume 350
6.3 Properties of beams extracted from ion sources 351
6.3.1 The emittance diagram of ion sources 351
6.3.2 Determination of the emittance diagram of the ion source 353

APPENDIX 357

Measurement of particle beam currents extracted from atom or ion sources 357

Physical quantities 366

Boiling, melting and sublimation temperatures at $p = 760$ mm Hg of a few materials of interest [1240] 367

Periodic system of elements 368

Table 1. Low lying atomic levels and the corresponding values of term and energy 370
Table 2. Metastable excited states 373
Table 3. The first ionization potentials and the corresponding values of λ_i 374
Table 4. Values of the ionization energy $E_i^{(n+i)} - E_i^n = E$ of atoms and ions in eV 376
Table 5. Experimental and theoretical values of the multiple ionization cross section for He, Ne, Ar and Hg 378
Table 6. Ionization cross section values for metastable atom impact 379
Table 7. State of autoionization 380
Table 8. Autoionization states of H^- ions 380
Table 9. Excitation energies and level widths of autoionization states in He atoms 381
Table 10. Binding energies of electrons in negative ions 382
Table 11. Molecular dissociation energies 385
Table 12. Values of the gas kinetical collision cross section σ_k and of the atomic diameter δ 388
Table 13. Melting and boiling points of metals. Temperatures at given pressures 389
Table 14. Melting and boiling points of metal oxides 391
Table 15. Values of the work function φ for elements and compounds under consideration 392
Table 16. Values of the secondary electron emission coefficient δ_{em} and those of the associated primary electron energy E_{em} 394
Table 17. Values of the surface recombination coefficient of materials used for the inside wall of discharge chambers for hydrogen atoms 396
Table 18. $\xi = l_n \frac{r_a}{r_k} - 0.3 \left(l_n \frac{r_a}{r_k}\right)^2 + \ldots$ 396
