

Table of Contents

Preface	11
Contributors	13
Chapter 1 – THE DEVELOPMENT OF ELECTRON-PROBE MICRO- ANALYSIS – AN HISTORICAL PERSPECTIVE <i>T. Mulvey</i>	
1.1 Backscattered Electrons, X-rays and the Electron-probe Analyser	16
1.1.1 Analysis of x-rays – the crystal spectrometer.	19
1.1.2 Electron optics and early electron microscopes	23
1.1.3 RCA electron-probe microanalyser	24
1.1.4 Castaing’s electron-probe x-ray microanalyser	26
1.1.5 Scanning electron-probe microanalyser.	28
1.1.6 Electron microscope/microanalyser	28
1.2 The Approach to Quantitative Electron-probe Microanalysis.	30
1.2.1 Castaing’s treatment	30
1.2.2 Philibert’s calculation of the absorption factor.	32
1.2.3 Discovery of the atomic number effect.	33
1.2.4 Concluding remarks	34
Chapter 2 – THE PHYSICAL BASIS OF QUANTITATIVE ANALYSIS <i>V. D. Scott</i>	
2.1 Electron Interactions in Solids	36
2.2 X-ray Emission Spectra	38
2.2.1 Characteristic x-ray spectra	39
2.2.2 Satellite lines.	43
2.2.3 Soft x-ray spectra.	44
2.2.4 The continuous x-ray spectrum.	44
2.3 Distribution With Depth of Generated X-rays.	48
2.4 X-ray Absorption	52

2.5	Intensity of Emitted X-rays	55
2.6	X-ray Fluorescence	57
2.7	The 'ZAF' or 'Matrix' Approach to Quantitative Analysis.	58
2.8	Spatial Distribution of X-rays	60

Chapter 3 – WAVELENGTH-DISPERSIVE X-RAY SPECTROMETERS

V. D. Scott

3.1	Geometry of Crystal Spectrometers	64
3.2	Analysing Crystals	69
3.3	X-ray Detectors	72
3.4	Performance Characteristics of a Gas Proportional Counter.	75
3.5	Counting Circuitry	77
3.6	Dead Time of the Counting System	79

Chapter 4 – ENERGY-DISPERSIVE X-RAY SPECTROMETERS

S. J. B. Reed

4.1	The Lithium-drifted Silicon, Si(Li), Detector.	81
4.2	Construction of the Si(Li) Detector	83
4.3	The FET Preamplifier	85
4.4	The Main Amplifier.	86
	4.4.1 Pole-zero cancellation	89
	4.4.2 Baseline restoration	89
4.5	Energy Resolution	90
4.6	Detector Response Function.	91
	4.6.1 Escape peaks	92
	4.6.2 Internal silicon fluorescence	93
4.7	Detector Efficiency.	93
4.8	Pulse Pile-up	95
4.9	Dead Time	97
	4.9.1 Beam switching	98
4.10	The Harwell Pulse Processor	99
4.11	The Multichannel Pulse-height Analyser	100

Chapter 5 – PROCESSING ENERGY-DISPERSIVE SPECTRA

S. J. B. Reed

5.1	Peak Identification	103
5.2	Spectral Artefacts.	104
	5.2.1 Escape peaks	104
	5.2.2 Internal silicon fluorescence peak	104
	5.2.3 Sum peaks	105

5.3	Background Subtraction Methods	105
5.3.1	Continuum modelling	105
5.3.2	Use of a reference background spectrum	108
5.3.3	The problem of continuum absorption	108
5.3.4	Mathematical filtering	109
5.4	Peak Integration and Overlap Corrections	111
5.4.1	Errors due to peak shift and broadening	114
5.5	Least Squares Fitting.	115
5.5.1	The filter-fit method.	116
5.5.2	Non-linear fitting	118
5.5.3	Sequential simplex method	119
5.6	Accuracy and Detection Limits	120
5.7	Light-element Analysis	121

Chapter 6 – EXPERIMENTAL DETERMINATION OF X-RAY INTENSITIES

M. G. C. Cox

6.1	Specimen	125
6.1.1	Mounting and polishing	125
6.1.2	Coating	129
6.1.3	Locating features of interest.	132
6.2	Selection of Standards.	133
6.3	Microanalyser Operating Conditions.	134
6.3.1	Specimen geometry	134
6.3.2	Electron accelerating voltage	134
6.3.3	Beam current.	135
6.3.4	Minimising contamination	135
6.3.5	Measuring x-ray intensities	137
6.4	Statistics.	137
6.4.1	Standard errors	137
6.4.2	Counting strategy	139
6.4.3	Detection sensitivity	140
6.5	Comparison of WD and ED Methods	142
6.5.1	Stability	142
6.5.2	Efficiency of x-ray detection	143
6.5.3	Spectral resolution	146

Chapter 7 – THE ATOMIC NUMBER CORRECTION

M. G. C. Cox

7.1	Stopping Power Factor	148
7.1.1	Duncumb-Reed method	149
7.1.2	Philibert-Tixier method.	151
7.1.3	Love-Cox-Scott method	152

7.2	Electron Backscattering	154
7.3	Backscatter Factor	157
7.4	Comparison of Atomic Number Corrections	161

Chapter 8 – X-RAY ABSORPTION CORRECTION

G. Love

8.1	Graphical Methods	163
8.1.1	$f(\chi)$ curves	163
8.1.2	Andersen-Wittry	164
8.2	Analytical Expressions of Philibert.	165
8.2.1	Derivation.	166
8.2.2	Selection of σ and h values for the simplified model	169
8.2.3	Selection of σ , h and $\phi(0)$ values for the rigorous model.	170
8.3	Methods Based Upon the Philibert Approach	171
8.3.1	Heinrich's simplifications.	171
8.3.2	Reuter	171
8.3.3	Ruste-Zeller	173
8.4	Methods Based on $\phi(\rho z)$ Curve Fitting	174
8.4.1	Offset Gaussian	177
8.4.2	Parobek-Brown	177
8.4.3	Bishop	179
8.4.4	Thin film	181
8.5	Specimens Inclined to the Electron Beam	182
8.6	Input Parameters	184
8.7	Mass Absorption Coefficients	186
8.7.1	Coefficients for the wavelength range $1\text{\AA} < \lambda < 10\text{\AA}$	186
8.7.2	Coefficients for the wavelength range $10\text{\AA} < \lambda < 120\text{\AA}$	190
8.7.3	Extended fine structure.	192

Chapter 9 – FLUORESCENCE CORRECTIONS

S. J. B. Reed

9.1	Fluorescence Excitation.	193
9.2	Fluorescence Excitation Efficiency	194
9.3	Characteristic Fluorescence	195
9.3.1	The effect of the $K\beta$ line	198
9.3.2	Fluorescence in ternary and higher-order compounds	199
9.4	The Absorption Term	199
9.4.1	The effect of finite source size	202
9.5	Fluorescence Involving L Lines	203
9.6	Continuum Fluorescence	206
9.7	Boundary Effects	211
9.8	Fluorescence in Thin Films.	214

Chapter 10 – EVALUATION OF ZAF METHODS*G. Love*

10.1	Experimental Microanalysis Data	218
10.2	Evaluation of Atomic Number Corrections	219
10.3	Methods for Evaluating the Absorption Correction	219
	10.3.1 Ratios of $f(\chi)$ plotted as a function of χ	220
	10.3.2 Study of $\phi(\rho z)$ curves	220
10.4	Requirements of an Absorption Correction	220
10.5	Simplified Philibert Method	222
10.6	Methods Based Upon the Rigorous Philibert Treatment	226
	10.6.1 Reuter	227
	10.6.2 Ruste-Zeller	228
10.7	Methods Based on $\phi(\rho z)$ Curve Fitting	231
	10.7.1 Parobek-Brown	231
	10.7.2 Love-Scott	231
10.8	Conclusions and Future Prospects	232

Chapter 11 – CORRECTION PROCEDURES IN PRACTICE*G. Love*

11.1	Iteration Procedures	235
	11.1.1 Simple iteration	235
	11.1.2 Hyperbolic iteration	236
	11.1.3 Wegstein iteration	237
	11.1.4 Comparison of methods	238
	11.1.5 An example	239
11.2	Computing	244
	11.2.1 The computer system	244
	11.2.2 The computer program	245
	11.2.3 Input	247
	11.2.4 Output	248
11.3	Alpha Factors	251
11.4	Standardless Analysis	254
	11.4.1 Basic principles	254
	11.4.2 Russ.	255
	11.4.3 Nasir	256
	11.4.4 Comparison of standardless methods	258
11.5	Method of Peak-to-Background Ratios	260

Chapter 12 – THE MONTE CARLO METHOD*M. G. C. Cox*

12.1	Simulation of an Electron Trajectory	264
12.2	Elastic Scattering	266
	12.2.1 Single scattering	266
	12.2.2 Multiple scattering	268

12.3	Inelastic Scattering	270
12.4	Random Number Generation	271
12.5	Discussion of Monte Carlo Models	272
12.6	Applications of the Method	275
	12.6.1 Electron distributions	275
	12.6.2 Distribution of characteristic x-rays in bulk samples	278
	12.6.3 Distribution of continuum x-rays in bulk samples	278
	12.6.4 Particles and thin films	279
Chapter 13 – COATINGS, THIN FILMS AND PARTICLES		
<i>V. D. Scott</i>		
13.1	Thin Coatings on Substrates	285
	13.1.1 Experimental calibration methods	285
	13.1.2 Methods based upon $\phi(\rho z)$ calculations	286
	13.1.3 Methods incorporating Monte Carlo calculations.	290
13.2	Thin Unsupported Films	292
	13.2.1 Spatial resolution	292
	13.2.2 X-ray intensities	295
	13.2.3 Analysis using a solid standard	297
	13.2.4 Analysis using a thin film standard.	298
	13.2.5 Double ratio method using characteristic x-rays	299
	13.2.6 Standardless methods	300
	13.2.7 Double ratio method using continuum x-rays.	303
	13.2.8 Atomic number, absorption and fluorescence effects	304
	13.2.9 Measurement of foil thickness.	309
	13.2.10 Spurious x-ray signals and other artefacts	313
13.3	Particles	316
	References	320
	Index	337
