

I. Physical Significance of the NUMATRON Project

- Evolutional Trends in Current Nuclear Physics -

(T. Marumori, T. Maskawa, K. Fujikawa, Y. Hirao and K. Sugimoto)

Contents

1. Introduction	1
2. Nuclear Physics as a Science of Matter	1
3. Concept of Nuclear Structure in the Present Stage	5
3-1. Nuclear Constitution and Saturation Property	5
3-2. Independent Particle Motion and Collective Mode of Motion	7
3-3. Nuclear Many-Body Problem (Microscopic Description of Collective Motion)	9
3-4. Elementary Modes of Excitation	12
3-5. Concept of Rotational Motion	15
4. Nuclear Forces and Nuclear Matter	16
4-1. Main Features of Nuclear Forces	16
4-2. Theory of Nuclear Matter	20
4-3. High Density Nuclear Matter	24
4-4. Pion Condensation	25
5. Some Topics in Current Study of Nuclear Structure	27
5-1. Interplay and Mutual Transformation among Elementary Modes of Excitation	28
5-2. Nuclear States under Extreme Conditions with Very Large Angular Momentum	28

5-3.	Heavy-Ion Reaction Processes	30
5-4.	New Scope for Nuclear Many-Body Problem	33
6.	New Perspectives and Some Future Speculations in Nuclear Physics . .	34
6-1.	Nuclear Compression and Shock Wave	35
6-2.	Phase Transitions of Nuclear Matter	36
6-3.	Nucleus as a Many-Body System of Hadrons	38
6-4.	Nucleus Viewed as a Composite System of Quarks	39
