

CONTENTS

INTRODUCTION	x
1. BASIC CONCEPTS OF DISCHARGES AND PLASMAS	
1.1. The motion of a charged particle in a gas	1
1.2. Inclusion of the effects of inelastic collisions	5
1.3. Motion of charged particles in a magnetic field	7
1.4. Motion of an electron gas	10
1.5. Boltzmann's equation	13
1.6. Plasma variables in terms of the distribution functions	17
2. THE POSITIVE COLUMN	
2.1. The self-sustaining glow discharge	20
2.2. Calculation of ionization rates	22
2.3. The plasma balance equation	23
2.4. Collisions with boundary walls	24
2.5. A simple model of a plane positive column	26
2.6. The free-fall model of the positive column	29
2.7. Extending the models	30
3. MAGNETIC FIELD EFFECTS	
3.1. The positive column in a magnetic field	38
3.2. The positive column in a magnetic field at high pressures and magnetic field strengths	42
3.3. Diamagnetism of a plasma column	46
3.4. The Hall effect in the positive column	48
4. EFFECTS OF SPACE CHARGE	
4.1. The influence of a physical boundary to a plasma	51
4.2. A simple model for the space charge sheath at low pressure	51
4.3. Generalizing the Bohm criterion	55
4.4. Joining active plasma and sheath	58
4.5. Asymptotic analyses of the positive column	65
4.6. Finite ion temperature	67
4.7. Detailed conditions adjacent to a wall	70
4.8. Axial sheaths in a positive column	72
4.9. The cathode region of a hot-cathode discharge	72
4.10. The double sheath	76
5. RADIALLY VARYING AND TIME-VARYING POSITIVE COLUMNS	
5.1. Variation of neutral density	81
5.2. Radial variation of the charged-particle temperatures	86
5.3. The positive column with negative ions	88
5.4. Contraction of the positive column	92
5.5. Thermal effects in the positive column	94
5.6. Volume recombination in the positive column	95
5.7. Contraction due to the combined effects of gas heating and volume recombination	96

5.8. Contraction due to radial variation in the electron energy distribution function	97
5.9. Contraction in electron-attaching gases	102
5.10. The afterglow positive column	103
5.11. Afterglows containing negative ions	108
5.12. The positive column with an alternating current	109
6. ELECTRON PLASMA WAVES	
6.1. Longitudinal electron waves in infinite uniform plasma	112
6.2. Experimental measurements	116
6.3. Axial propagation in a uniform cylindrical column	117
6.4. Axial propagation in a strongly magnetized uniform plasma column	119
6.5. Radially propagating longitudinal waves in an unmagnetized column	121
6.6. Damping of radially propagating waves	124
6.7. General propagation of longitudinal waves in a column	128
6.8. Axial propagation in a finite magnetic field	128
6.9. Radial propagation perpendicular to a finite magnetic field—Bernstein waves	131
6.10. Bernstein waves in a non-uniform plasma	135
7. ION WAVES	
7.1. The fluid approximation	138
7.2. Kinetic theory of ion waves	140
7.3. Measurements showing kinetic effects	142
7.4. Finite plasma and other effects	143
7.5. Ion waves in positive columns	145
7.6. Waves in plasmas with relative drift between ions and electrons	149
7.7. The influence of collisions and finite geometry on the two-stream instability	152
7.8. The ion acoustic instability	152
7.9. Ion waves propagating across the positive column	155
8. IONIZATION WAVES	
8.1. Non-isothermal waves at low pressures	159
8.2. The relation between ion waves and ionization waves	161
8.3. Ionization waves at higher pressures	162
8.4. Metastable-guided ionization waves	166
8.5. The influence of electron energy distribution	168
8.6. The effect of finite column radius on ionization waves	169
8.7. Ionization waves in a magnetic field	171
8.8. Waves at low pressure with more than one species of ion	173
8.9. Waves in recombination-dominated plasmas	176
8.10. Waves at high pressures in electron-attaching gases	177
8.11. Unstable ionization waves and striations	179
9. LOW FREQUENCY WAVES IN A MAGNETIZED PLASMA	
9.1. Transverse wave propagation along a steady magnetic field	183
9.2. Propagation perpendicular to the magnetic field	186
9.3. Propagation at an angle to the magnetic field	188

9.4. Inclusion of electron temperature—ion cyclotron waves	189
9.5. Experiments involving whistler and helicon waves	191
9.6. Electron cyclotron waves	193
9.7. Experimental measurement of Alfvén waves	196
9.8. The slow Alfvén wave	200
9.9. Non-axisymmetric Alfvén waves	200
9.10. Ion Bernstein waves	201
9.11. Concluding remarks	205
10. DRIFT WAVES	
10.1 Drift waves as modified ion waves	206
10.2 Drift waves at high phase velocities	209
10.3 The drift dissipative instability	213
APPENDIX I: General solutions of the Boltzmann equation	219
APPENDIX II: The permittivity tensor for a cold magnetized plasma	224
APPENDIX III: Wave propagation in cylindrical magnetized plasmas	229
APPENDIX IV: Wave propagation in warm plasmas	234
APPENDIX V: Physical constants and typical values of parameters	237
