

CONTENTS

In the paperback edition

Volume I: Principles includes chapters 1-10, pages 1-272

Volume II: Experiments includes chapters 11-17, pages 273-549

Volume III: Technology includes chapters 18-30, pages 550-855

Preface ----- xvii

Acknowledgements ----- xix

PRINCIPLES

1. Energy Sources	
1A. Forms of Energy -----	1
1B. Energy Demand -----	1
energy uses	
relation to standard of	
living	
predictions of demand	
1C. Energy Sources -----	4
power flows	
limits of usable energy	
1D. Solar Energy -----	6
1E. Fusion Reactions -----	8
energy release	
fusion fuels	
1F. Fusion Reactors -----	10
research progress	
power plants	
1G. Summary -----	14
Problems -----	14
Bibliography -----	15
2. Nuclear Reactions and Coulomb Collisions	
2A. Distribution Functions and Averages -----	16
2B. Cross Sections and Reaction Rates -----	19
monoenergetic beam on stationary target	
moving target	
two Maxwellian distributions	
interactions among like particles	
beam and Maxwellian	
two colliding beams	
collision frequency and mean free path	
2C. Nuclear Fusion Reaction Rates -----	26
2D. Power Density and Pressure -	30

Contents

2E. Coulomb Collisions -----	35	5. Plasma Fundamentals
basic equations		
evaluation of δp and δW		
Coulomb scattering cross		
section		
Coulomb logarithm		
results		
applications		
Problems -----	46	
Bibliography -----	48	
3. Atomic Collisions and Radiation		
3A. Types of Collisions -----	49	
3B. Scattering and Momentum Transfer -----	51	
3C. Molecular Collisions -----	52	
3D. Atomic Collision Phenomena ---	55	
3E. Equilibrium Degree of Ionization -----	60	
equilibrium conditions		
Saha equation		
coronal case		
3F. Radiation Losses -----	62	
radiation processes		
approach to coronal equilibrium		
coronal equilibrium case		
cyclotron radiation		
Problems -----	70	
Bibliography -----	72	
4. Fusion Reactor Power Balance		
4A. Conservation Equations -----	73	
4B. Equilibrium and Ignition -----	75	
equal temperatures and no fuel depletion		
catalyzed DD reactor		
ignition		
impurity effects		
4C. Energy Cycle -----	79	
simple cycle		
cycles with direct conversion		
4D. Required Values of $n\tau_E$ -----	85	
steady state reactors		
pulsed reactors		
burnup fraction		
4E. Mirror Reactors -----	89	
4F. Beam-driven Toroidal Reactors -	91	
4G. Non-uniform and Time-varying Plasmas -----	93	
spatial variations		
4H. Comparison of Reactor Types ---	96	
summary		
Problems -----	98	
Bibliography -----	100	
5A. Introduction -----	101	
background		
fourth state of matter		
5B. Electromagnetic Fields and Forces -----	104	
charge and current densities		
Maxwell Equations		
vector and scalar potentials		
forces on individual particles		
fluid forces		
5C. Kinetic Theory -----	109	
5D. Fluid Equations -----	110	
two-fluid theory		
ambipolar motion		
transport coefficients		
Boltzmann relation		
MHD equations		
5E. Plasma Waves -----	121	
cold plasma model		
dispersion relation		
phase and group velocities		
wave growth and damping		
cutoffs and resonances		
propagation along \vec{B}		
propagation perpendicular to \vec{B}		
5F. Debye Shielding and Plasma Sheaths -----	130	
screening of potential from point charge		
potential variation near wall or probe		
5G. Quasineutrality -----	133	
plasma behavior		
5H. Computer Methods -----	134	
finite difference equations		
quasiparticle methods		
Problems -----	137	
Bibliography -----	138	
6. Gas Discharges and Breakdown		
6A. Background -----	140	
6B. Townsend Discharges -----	140	
6C. Simplified Breakdown Condition -----	143	
6D. Other Phenomena Influencing Breakdown -----	145	
6E. Glow and Arc Discharges ---	146	

Contents

xi

6F. Space Charge Limitation of Current -----	147	8E. Microinstabilities -----	197
Problems -----	149	types of interactions	
Bibliography -----	150	non-Maxwellian distributions	
7. Charged Particle Trajectories		anisotropic distributions	
7A. Guiding Center Approximation -	151	gradients and drift waves	
7B. Diamagnetism -----	154	8F. Transport -----	204
7C. Drift Velocities -----	154	transport equations	
7D. Adiabatic Invariants and Magnetic Mirrors -----	158	additional considerations	
magnetic moment		transport theories	
magnetic mirrors		random walk model	
other adiabatic invariants		8G. Confinement Times -----	210
7E. Particle Orbits in Tokamaks --	161	definitions	
$v_{\parallel} \gg v_{\perp}$ case		experimental measurements	
$v_{\parallel} \sim v_{\perp}$ case		theoretical estimates	
summary		Problems -----	213
Problems -----	166	Bibliography -----	215
Bibliography -----	167	9. Plasma Heating	
8. Plasma Confinement		9A. Methods -----	217
8A. Introduction -----	168	9B. Ohmic Heating -----	217
means of plasma containment		increased resistivity	
magnetic field shapes		electron runaway	
thermodynamic equilibrium		9C. Compression -----	219
and plasma equilibrium		shock heating	
energy loss mechanisms		adiabatic compression	
8B. Magnetic Confinement -----	171	9D. Charged Particle Injection -	222
equilibrium conditions		charged particle beams	
magnetic pressure		plasma guns	
plasma beta		9E. Neutral Beam Injection ----	223
divergences		penetration	
8C. Axisymmetric Toroidal Equilibrium -----	175	neutral beam ion sources	
derivation of Grad-Shafranov Equation		electrodes	
properties of the Grad-Shafranov Equation		neutralizer and deflection magnet	
8D. MHD Instabilities -----	179	beam duct and pumping	
the ball analogy		9F. Wave Heating -----	229
linearized MHD equations		stages of wave heating	
eigenvalues		plasma resonances	
example of normal mode analysis		cavity resonances	
energy principle		wave heating problems	
interchange instability		Problems -----	233
types of MHD instabilities		Bibliography -----	234
ballooning modes		10. Plasma Diagnostics	
tearing modes		10A. Introduction -----	237
summary		10B. Electrical Probes -----	238
		10C. Magnetic Flux Measurements -	240
		10D. Passive Particle Diagnostics	241
		electrons and ions	
		charge-exchange neutral atoms	
		neutrons	
		10E. Active Particle Diagnostics	245
		ion beam probes	
		neutral beam probes	

Contents

10F. Passive Wave Diagnostics -----	247	11F. Field Reversed Mirrors ---	296
photography		concept	
spectroscopic analysis of		production	
hydrogen density		reactor concepts	
impurity radiation		11G. Multiple Mirrors -----	300
spectral line broadening		configuration	
spectral line intensities		steady state mode	
soft x-ray measurements		pulsed mode	
hard x-ray measurements		11H. Rotating Plasmas -----	302
far-infrared and microwave		11J. Cusps -----	303
measurements		confinement	
10G. Active Wave Diagnostics -----	253	untrapped particles	
microwave reflection		sheath thickness	
resonant cavity measure-		TORMAC	
measurements		Bibliography -----	307
plasma refractive index			
microwave interferometers			
Mach-Zehnder laser inter-			
ferometers			
Ashby-Jephcott		12. Pinches and Compact Toroids	
interferometer			
quadrature interferometers		12A. Types of Pinches -----	311
far-infrared (FIR)		Z pinches	
interferometers		plasma focus	
holographic interferometry		imploding liner	
Faraday rotation		inverse pinch and hard-	
Thomson scattering		core pinch	
10H. TFTR Diagnostics -----	264	toroidal Z-pinch	
10J. Summary -----	267	linear theta pinch	
Problems -----	269	toroidal theta pinch	
Bibliography -----	270	screw pinch and belt	
		pinch	
		EXTRAP	
		compact toroids	
		12B. Field-Reversed Theta Pinch	323
		formation	
		equilibrium and	
		stability	
		parameter scaling	
		experiments	
		12C. Spheromak -----	329
		equilibrium and	
		stability	
		production by pinches	
		and guns	
		slow induction technique	
		applications	
		12D. Reversed Field	
		Pinch (RFP) -----	336
		equilibrium and	
		stability	
		experiments	
		12E. Pitch-Reversed Helical	
		Pinch -----	341
		equilibrium and	
		stability	
		experiments	
		12F. Topolotron -----	345
		topological stability	
		experiment	
		Bibliography -----	347

EXPERIMENTS

11. Mirrors and Cusps

11A. Coil Geometries -----	273
mirror coils	
cusp coils	
11B. Mirror Loss Boundaries -----	277
11C. Instabilities -----	278
drift cyclotron loss cone	
(DCLC) mode	
mirror mode and Alfvén ion	
cyclotron mode	
convective loss cone mode	
ballooning mode	
11D. 2X11B Experiment -----	281
11E. Tandem Mirrors -----	283
potential barriers	
plug ions	
central cell confinement	
thermal barriers	
power gain ratio	
experiments	
MFTF-B	

13. Tokamaks

13A. MHD Stability -----	350
introduction	
ideal kink modes	
ideal internal modes	
ideal axisymmetric ($n = 0$)	
modes	
resistive interchange modes	
resistive tearing modes	
disruptive instability	
ballooning modes and beta	
limits	
operating regimes	
Mirnov oscillations	
sawtooth oscillations	
effects of plasma shape	
13B. Transport -----	362
neoclassical transport	
anomalous transport	
transport codes	
experimental measurements	
burn control	
13C. Heating -----	372
ohmic heating	
neutral beam injection	
rf heating	
compression	
other heating methods	
13D. Current Drive -----	377
magnetic induction	
bootstrap current	
neutral-beam-driven current	
electron-beam-driven	
current	
rf current drive	
13E. Runaway Electrons -----	382
generation	
limitations of runaway	
velocity	
experimental observations	
13F. Scaling -----	386
energy confinement	
temperatures in ohmically-	
heated tokamaks	
ignition	
large tokamaks	
Bibliography -----	389

14. Other Toroidal Devices

14A. Stellarators and Torsatrons	393
stellarator magnetic	
fields	
torsatron fields	
modular coils	
equilibrium and stability	
transport	
experiments	
reactors	
14B. Internal Rings -----	406
magnetic field	
configurations	
experiments	
14C. Electron and Ion Rings ----	411
field reversal	
injection into toruses	
14D. Elmo Bumpy Torus (EBT) ----	414
introduction	
particle orbits	
equilibrium and stability	
ring stability	
heating	
transport	
ring power balance	
experiments	
reactors	
14E. Electric Field Bumpy Torus	437
Bibliography -----	437
15. Inertial Confinement Fusion (ICF)	
15A. Introduction -----	441
ICF reactors	
compression	
problems	
15B. Energy Gain -----	444
required energy gain	
burnup fraction	
attainable energy gain	
15C. Laser-Plasma Interactions -	450
plasma production	
collisional absorption	
resonance absorption	
wave-coupling processes	
stimulated Brillouin	
scattering	
preheating	
self-focusing	
magnetic fields	
15D. Compression -----	460
rocket equation	
hydrodynamic efficiency	
ablation pressure	
shell stability	

15E. Targets ----- 465	exploding pushers ablative compression ion beam targets target specifications fabrication characterization positioning	16G. Heavy Ion Beams ----- 506 required parameters emittance rf linacs induction linacs design considerations
15F. Diagnostics ----- 473	laser-plasma interactions x-ray measurements charged particle measurements neutron measurements neutron activation analysis	16H. Chambers ----- 515 general considerations dry walls wetted walls magnetically protected walls liquid metal streams gas-protected walls comparisons
	Bibliography ----- 479	Bibliography ----- 522
16. ICF Drivers and Chambers		17. Other Fusion Concepts
16A. Glass Lasers ----- 482	fluence limitations amplifiers parasitic oscillations spatial filters isolators glass properties frequency shifting	17A. Radiofrequency Confinement 524 cavity modes and Q quasipotential wells power requirements high-pressure discharges
16B. CO ₂ Lasers ----- 487	amplifiers optics power supplies efficiency	17B. Radiofrequency Plugging --- 527 theory experiments
16C. Rare Gas Halide Lasers ----- 489	characteristics pumping other lasers backward wave Raman scattering pulse stacking	17C. Electrostatic Confinement - 531 17D. Electrostatic Plugging ---- 533 particle loss processes power gain ratio experiments
16D. Other Lasers ----- 493	HF lasers iodine lasers Group VI lasers excimer lasers solid state lasers	17E. Wall Confinement ----- 537 17F. Imploding Liner ----- 539 17G. Colliding-beam Mirror ----- 541 17H. Hypervelocity Impact ----- 543 required parameters accelerators
16E. Electron Beams ----- 496	pulse formation insulation diodes beam propagation applications	Bibliography ----- 546
16F. Light Ion Beams ----- 501	production focusing and transport Particle Beam Fusion Accelerator (PBFA) high average power systems	TECHNOLOGY
		18. Fusion Engineering Problems
18A. Problem Areas ----- 550	plasma vacuum materials blanket and shield magnets environment economics	
18B. Maintenance ----- 554	general principles scheduled and unscheduled maintenance	

Contents

xv

18C. A Tokamak Reactor Design -----	557	20C. Coil Forces -----	608
STARFIRE design features		long, parallel wires	
plasma		coaxial circular loops	
limiter and vacuum system		solenoids	
first wall, blanket, and		force-reduced torsatron	
shield		coils	
magnets		coil design	
environment		considerations	
economics		20D. Power and Cooling Water	
18D. A Mirror Reactor Design -----	565	Requirements -----	612
WITAMIR-I		relation of magnetic	
plasma		field to coil power	
blanket and shield		cooling water	
environment and economics		20E. Coil Windings -----	615
Bibliography -----	571	Problems -----	617
		Bibliography -----	619
19. Vacuum Systems		21. Pulsed Magnet Systems	
19A. Background -----	572	21A. Introduction -----	620
historical development		21B. RLC Circuit Equations -----	620
need for ultra-high vacuum		resistance and inductance	
19B. Viscous and Molecular Flow --	574	21C. Distribution of \vec{J} and \vec{B} ---	624
types of flow		single-turn high-field	
throughput		solenoids	
flow equations		21D. Energy Storage Systems -----	626
conductance		21E. Switching and Transmission	629
pumpdown time		21F. Magnetic Flux Compression -	631
19C. Pumps -----	580	21G. Component Reliability -----	632
mechanical pumps		Problems -----	634
jet pumps		Bibliography -----	635
ionization pumps			
sublimation pumps			
cryosorption pumps			
cryogenic pumps			
19D. Pressure Gages -----	585	22. Superconducting Magnets	
19E. Chambers and Components -----	589	22A. Superconductivity -----	636
19F. Techniques -----	591	domain of	
monolayers		superconductivity	
cleaning		electron pairing	
leak detection		energy gap	
diffusion		diamagnetism	
Problems -----	594	flux quantization	
Bibliography -----	595	Type I and Type II	
		superconductors	
20. Water-Cooled Magnets		critical current density	
20A. Background -----	596	in Type II materials	
20B. Magnetic Field Calculations -	597	magnet coils	
basic equations		22B. Superconductors -----	642
straight wires		22C. Stabilization -----	645
toruses and solenoids		need for stabilization	
circular loops		methods of stabilization	
circular coils with		22D. Coil Protection -----	648
rectangular cross		fault conditions	
sections		protection circuitry	
axial field of solenoid		fault detection	
complex coil shapes		22E. Coil Design Considerations	650
		conductor design	
		heat removal	
		structural design	

22F. Large Coils -----	653	24G. Impurity Introduction -----	700
MFTF magnets		physical sputtering	
Large Coil Test Facility		physicochemical sputtering	
(LCTF)		chemical erosion	
22G. Superconducting Magnetic		desorption	
Energy Storage -----	656	vaporization	
Problems -----	658	blistering and flaking	
Bibliography -----	659	unipolar arcs	
23. Cryogenics		synergistic effects	
23A. Introduction -----	662	24H. Near-Surface Wall	
23B. Properties of Materials at		Modifications -----	710
Low Temperatures -----	663	phase changes	
mechanical properties		alloy composition changes	
thermal properties		microstructural changes	
electrical resistivity		macrostructural changes	
cryogenic liquids		property changes	
23C. Refrigeration and		materials development	
Liquefaction -----	668	24J. Special Purpose Materials -	711
23D. Insulation -----	670	graphite and silicon	
23E. Cryostat Design -----	672	carbide	
23F. Cryogenic Systems -----	673	heat-sink materials	
Problems -----	676	ceramics	
Bibliography -----	677	superconducting magnet	
24. Materials Problems		materials	
24A. Introduction -----	678	Problems -----	717
24B. Damage Analysis and		Bibliography -----	718
Fundamental Studies -----	678		
damage production			
damage microstructure			
evolution			
24C. Analysis and Evaluation ----	682	25. Plasma Purity and Fueling	
structural life		25A. Impurities -----	722
predictions		impurity effects	
thermal stress		impurity concentrations	
test procedures		helium accumulation	
compatibility		equilibrium helium	
fabrication		concentration	
24D. Mechanical Behavior -----	687	modes of operation	
strength		25B. Divertors -----	727
ductility		types of divertors	
fatigue		plasma flow	
thermal creep		divertor target and	
24E. In-Reactor Deformation ----	694	pumping	
swelling		tokamak divertors	
irradiation creep		other divertors	
24F. Hydrogen Recycling -----	696	25C. Neutral Gas Blankets -----	734
reflection		25D. Other Impurity Control	
spontaneous desorption		Techniques -----	736
stimulated desorption		impurity injection	
applications		gas flow	
		neutral beam injection	
		pumped limiters	
		25E. Fueling -----	738
		gas blankets	
		plasma guns	
		neutral beam injection	
		cluster injection	
		pellet injection	
		Problems -----	743
		Bibliography -----	745

Contents

xvii

26. Blankets	
26A. Introduction -----	747
energy conversion efficiencies	
blanket design problems	
26B. Blanket Materials -----	751
neutron multipliers	
breeding materials	
coolants	
structural materials	
26C. Heat Transfer Processes -----	755
radiation	
convection	
conduction	
26D. Coolant Tube Stresses -----	760
26E. Coolant Flow Rate and Pumping	
Power -----	762
flow rates	
pressure drop and pumping	
power	
power flux limitations	
Blanket Designs -----	765
coolant flow configurations	
flowing blanket designs	
pressure tube designs	
pressurized module designs	
26G. Direct Energy Conversion ----	770
principles	
plasma direct convertors	
beam direct convertors	
26H. Fuel Production -----	773
Problems -----	774
Bibliography -----	775
27. Neutronics	
27A. Introduction -----	777
goals	
methods	
27B. Transport Theory -----	778
Boltzmann equation	
Legendre expansion	
discrete ordinates method	
27C. The Monte Carlo Method -----	783
decisions	
location of next interaction	
type of interaction	
new direction and energy	
tallying	
error estimates	
number of case histories needed	
variance reduction techniques	
27D. Blanket and Shield Designs	791
flux distribution and	
neutron balance	
tritium breeding	
energy deposition	
radiation damage	
benchmark calculations	
neutron streaming	
Problems -----	798
Bibliography -----	799
28. Environment and Economics	
28A. Introduction -----	801
28B. Tritium -----	802
biological hazard	
production rate	
tritium inventory	
routine releases	
tritium permeation rates	
tritium recovery systems	
accidental tritium release	
28C. Other Radioisotopes -----	811
production	
afterheat and biological hazard	
disposal	
recycling	
28D. Hazards and Materials	
Shortages -----	818
hazards	
materials shortages	
helium	
summary	
28E. Economics -----	821
electrical power cost	
cost scaling	
Problems -----	827
Bibliography -----	828
29. Fusion-Fission Hybrids	
29A. Need -----	830
depletion of fissile fuel supplies	
fissile fuel production	
comparison with fusion and fission	
29B. Blanket Design -----	832
considerations	
neutron interactions	
fuel forms	
cost goals	
29C. Tokamak Hybrids -----	835
large tokamaks	
small beam-driven tokamaks	

29D. Mirror Hybrids -----	840
other types of hybrids	
29E. Catalyzed DD Hybrids -----	844
advantages	
neutronics	
advantage of ^{233}U fuel	
economics	
Bibliography -----	847

30, The Future

30A. Experimental Progress -----	848
30B. Remarks -----	849
Edwin E. Kintner	
Stephen O. Dean	
Toshiro Ohkawa	
Harold P. Furth	
T. Kenneth Fowler	
Gerold Yonas	

Appendices

Appendix A. SI Units	-----	A-1
Appendix B. Fundamental Constants	-----	A-4
Appendix C. Integrals	-----	A-5
Appendix D. Important Plasma Equations	-----	A-6
Appendix E. Error Function	-----	A-8
Appendix F. Vector Relations	-----	A-9
Appendix G. Table of Symbols	-----	A-11
Appendix H. Abbreviations	-----	A-25
Appendix I. Answers to Problems	-	A-28

Name Index ----- I-1

Subject Index ----- I-15
