Organization

Research Summaries

Group I: Reactor Materials and Plasma-wall Interactions

I. 1	Fusion reactor materials and plasma-wall interactions	1
I. 2	Irradiation behaviour of materials under complex conditions and the modelling of the behaviour	2
I. 3	Evaluation of isotropic graphite as fusion first wall materials and stabilities against plasmas	4
I. 4	Development of low activity vanadium-base alloys under fusion reactor environment	6
I. 5	Relation between radiation-induced segregation and corrosion resistance in ferritic steels	8
I. 6	Defect structures and mechanical properties of materials irradiated by fusion neutrons with RTNS-II	10
I. 7	The irradiation effects on the microstructure and properties of reduced radio-activation steels	12
I. 8	Deformation and fracture at high temperature of neutron and ion irradiated small specimen	14
I. 9	Evaluation of radiation damage in ceramics	15
I.10	Reflection phenomena of particles during hydrogen recycling process	17
I.11	Physical and chemical processes of ion wall-materials interactions in the low energy range (below 100 eV)	19
I.12	Thermal shock and fatigue properties of coated fusion reactor materials	21

Group II: Environmental and Biological Effects of Tritium

II. 1	The tritium studies in the Japanese fusion program (the steering committee)	23
II. 2	Variations of environmental tritium and their interpretation through the analysis	25
II. 3	Biomedical effects of tritiated water	27
II. 4	The transfer of tritium in the environment (II)	29
II. 5	Metabolism of tritium and its biological effects	31
II. 6	Oxidation of tritium gas by microbes and its mechanism	33
II. 7	Development of a tritium simulator by the use of ^{137}Cs sources for risk estimation of biological effects of tritium	35
II. 8	Tritium contents in Japanese bodies	37
II. 9	<i>In vivo</i> somatic mutation in mice induced by tritium	39
II.10	Relative biological effectiveness of tritium in various human cells and mammals	41

II.11	Radiation effect on nucleic acid induced by tritiated water	43
-------	---	----

Group III: Fundamentals of Reactor Plasma Control

III. 1	Time-resolvable measurement of implosion process by X-ray pinhole camera in the interaction of light ion beam with target	45
III. 2	Amplification of the high efficiency atmospheric ArF/KrF laser in a strongly saturated region	47
III. 3	Atomic processes in laser-imploded plasmas	49
III. 4	Polarized fuel fusion	51
III. 5	Antennas and transmission systems for high power RF plasma heating	53
III. 6	Heating and control of plasma by Alfvén waves	55
III. 7	Development of Schottky diode detector/mixers for high-temperature plasma diagnostics	57
III. 8	Experimental studies for the confinement of the plasma in the system with a helical axis	59
III. 9	Improvement of confinement of reversed field pinch	61
III.10	Formation and current sustainment of RFP by means of magnetic separatrix	63
III.11	Measurement of profiles of temperature and density in field-reversed configuration plasma	65
III.12	Development of the laser fluorescence for impurity detection in peripheral plasmas	67
III.13	Theory of elementary processes related to fusion research	69
III.14	Transport theory in fusion plasmas —Development of new theoretical method	71
III.15	Fundamental research on fusion plasma control (coordinating committee)	73
III.16	Development of diagnostic techniques of implosion plasma	76
III.17	Transport and control on RF-heated plasmas	80
III.18	Studies on the optimization of plasma confinement in external conductor systems	82
III.19	Computer experiments of nonlinear plasma dynamics	87

Group IV: Superconducting Magnets

IV. 1	Basic aspect of R & D of superconducting magnet technology (the fourth group)	89
IV. 2	Improvement and evaluation of advanced component wire materials for fusion magnet	91
IV. 3	New method of stabilization for high-current-density superconducting magnet	93
IV. 4	Development of advanced A15 type superconducting wires for high magnetic fields	95
IV. 5	Microstructure of A15 type superconductors and its influence on pinning force	97
IV. 6	Mechanical properties of structural materials for superconducting magnets (fatigue characteristics and optimum welding process)	99
IV. 7	A comprehensive study on flow and heat transfer in the cooling of superconducting magnet	101

IV. 8	Development of indirect cooling superconducting magnet	103
IV. 9	Energy losses due to mechanical disturbances in superconducting magnets	105
IV.10	Electromagneto-fracture mechanics approach on structural integrity assessment system of super-conducting magnet for fusion reactor	107
IV.11	Quench detection of superconducting magnets using ultrasonic wave	109
IV.12	Development of high current density superconductor by dynamic-cryogenic stabilization	111

Group V: Fusion Reactor Blanket Engineering

V. 1	Promotion of fusion reactor blanket engineering	113
V. 2	Benchmark experiment on fusion neutron transmission and development of the calculational methods	115
V. 3	Magneto-hydro-dynamic, thermal and structural studies on liquid metal lithium cooling of fusion reactors	117
V. 4	Prediction of long-term creep curves under service condition of nuclear fusion reactor . .	119
V. 5	Sodium mist cooling of a hot surface in compact cassette toroid reactor	121
V. 6	Development of flaw detection and repairing system for a fusion reactor first wall	123
V. 7	First wall behavior under disruption load	125
V. 8	Inelastic behavior of PCA material under biaxial stress state	127
V. 9	Fusion reactor blanket cooling by use of gas-solid suspension medium	129
V.10	Breeding and recovery of tritium in CTR blanket	131
V.11	Applicability of Zr-alloy getters to recovery, purification and storage material of breeding tritium	133
V.12	Sintering control of lithium compounds for blanket	135

Group VI: Design and Evaluation of Fusion Reactor

VI. 1	Design and evaluation of fusion reactors (coordinating committee)	137
VI. 2	Tritium plasma experiment-plasma driven permeation	139
VI. 3	Plasma production and conditioning technology in Heliotron-E, Gamma-10 and Gekko-XII facilities (collaboration with established small groups)	141
VI. 4	Three-dimensional fracture mechanics analyses and evaluation of first wall under electromagnetic force	143
VI. 5	Characteristics of the DT and the advanced fuel fusion reactor	145
VI. 6	Quick replacement technology for high load core elements in high power density fusion reactor	147
VI. 7	Feasibility of magnetically insulated and inertially confined fusion	149
VI. 8	Space application of fusion energy	151
VI. 9	Sorption and desorption behavior of tritium on surface of piping materials	153
