Preface *page xv*

1	Introduction	1
1.1	The beginning of X-ray astronomy	1
1.2	An early history of the X-ray sky	4
1.3	Radio astronomy, an historical parallel	11
1.4	Astronomy and the space age – the first major accomplishments	14
1.5	The role of chance in astronomical discovery	22
2	The tools of X-ray astronomy	24
2.1	The proportional counter	24
2.2	The scintillation counter	27
2.3	Locating X-ray sources	28
2.4	Scanning the X-ray sky	33
2.5	X-ray imaging	35
2.6	X-ray spectroscopy	41
2.7	Advanced spectroscopic techniques	44
2.8	The Einstein X-ray Observatory	46
2.9	The European X-ray Astronomy Observatory, EXOSAT	47
2.10	ROSAT, the first deep all-sky survey	51
3	Supernova remnants	54
3.1	Introduction	54
3.2	The supernova explosion	56
3.3	Evolution of supernova remnants	62
3.4	Young shell-like remnants	68
3.5	Four older remnants	75
3.6	Remnants with neutron stars	81

4	Active stellar coronae	95
4.1	The Sun	95
4.2	The Einstein stellar X-ray survey	100
4.3	RS CVn systems	101
4.4	Flare stars	114
4.5	Young stars	116
4.6	Rotation – the evolutionary link?	118
4.7	The dynamo model	120
5	Early-type stars and superbubbles	122
5.1	O stars	122
5.2	The Carina Nebula	124
5.3	Eta Carinae – an O star in hiding?	128
5.4	The Cygnus superbubble	130
5.5	Formation of a superbubble	133
5.6	Supernova → star formation →supernovae → superbubble	134
5.7	The astronomer views the rest of the world	135
6	Normal galaxies	136
6.1	X-ray sources in the Milky Way	136
6.2	The Milky Way and the Local Group	137
6.3	X-ray observations of the Magellanic Clouds – our nearest neighbours	138
6.4	X-ray observations of M31	142
6.5	X-ray sources in other normal galaxies	145
6.6	Starburst galaxies	146
6.7	The nucleus of the Milky Way	149
6.8	Diffuse galactic emission	151
6.9	Summary and future prospects	154
7	Massive X-ray binary stars	155
7.1	The discovery of binary behaviour	155
7.2	Field guide to X-ray double stars	161
7.3	Discovery of X-ray pulsars	163
7.4	Spinning X-ray pulsars up and down	166
7.5	The X-ray source as a probe	171
7.6	X-ray transients	175
7.7	<i>Be</i> stars and X-ray pulsars	177
7.8	An accretion barrier?	179
7.9	A0538–66: the most luminous X-ray transient	179
7.10	Evolution of a massive X-ray binary	185
8	Low-mass X-ray binary stars	187
8.1	Introduction	187
8.2	Searching for binary behaviour	190
8.3	Partial and total eclipses, and X-ray dippers	192

8.4	Accretion disc coronae	194
8.5	X-ray bursters	197
8.6	Thermonuclear burning on the neutron star	198
8.7	The Rapid Burster	205
8.8	Optical bursts, too?	208
8.9	Why don't X-ray pulsars burst or X-ray bursters pulse?	209
8.10	Quasi-periodic oscillations	210
8.11	The magnetospheric model	213
8.12	Slow QPOs and the inner structure of the accretion disc	214
8.13	QPOs and the Rapid Burster	217
9	X-ray binaries in globular clusters	219
9.1	Introduction	219
9.2	X-ray bursts and precise X-ray locations	224
9.3	Are the cluster sources X-ray binaries?	224
9.4	Search for optical identitifications	227
9.5	M15 (4U2127+11)	227
9.6	Is AC211 being ejected from M15, or ejecting matter from itself?	229
9.7	Mass estimates	230
9.8	NGC 6624 (4U1820-30), the shortest orbital period known	231
9.9	Origin and evolution of M15 and NGC 6624 X-ray sources	233
9.10	Formation of millisecond radio pulsars	235
10	Cataclysmic variable stars	241
10.1	Dwarf novae and novae	241
10.2	Presence of accretion discs and UV/X-ray emission	243
10.3	Outburst	246
10.4	Magnetic binaries	246
10.5	Intermediate polars	249
10.6	Formation of a cataclysmic variable	252
10.7	Evolution to short periods	252
10.8	Superoutburst	254
10.9	Precessing accretion discs	256
11	Are there black holes in our galaxy?	260
11.1	Introduction	260
11.2	Measuring masses	261
11.3	Cygnus X-1 and LMC X-3	261
11.4	Soft X-ray transients	263
11.5	Other properties of black holes?	266
12	SS433 – the link with AGN	267
12.1	The strangest star of all?	267
12.2	The <i>moving</i> lines	270
12.3	Relativistic jets	274

12.4	Direct observations of the moving jets with the VLA	276
12.5	Interaction of the jets with the supernova remnant W50	276
12.6	SS433 as an X-ray binary	277
12.7	The engine driving the jets	278
12.8	The jet acceleration mechanism	282
13	Active galactic nuclei	285
13.1	Introduction	285
13.2	The range of activity in active galaxies	285
13.3	The origin of the radio jets	287
13.4	The supermassive object in NGC 4151	289
13.5	Our nearest active galaxy: Centaurus A	293
13.6	Evidence for an accretion disc in AGN	298
13.7	BL Lac objects	299
13.8	Towards the central engine: X-ray variability	301
13.9	The EXOSAT contribution	301
13.10	Quasars	303
13.11	X-ray spectra	304
13.12	An analogy with spectra of X-ray binaries	307
13.13	High resolution X-ray spectrum of a BL Lac object	307
14	Clusters of galaxies	310
14.1	Introduction	310
14.2	Results from optical observations	311
14.3	X-ray morphology	315
14.4	X-ray spectra	320
14.5	Radiative cooling in the Perseus Cluster and Abell 85	322
14.6	The formation of giant or dominant galaxies within clusters	327
14.7	Evolution	332
14.8	Present status	333
15	X-rays from planets	336
15.1	The production of planetary X-rays	336
15.2	Earth	337
15.3	The Moon	340
15.4	Jupiter	342
16	The diffuse X-ray background	345
16.1	Early observations and general characteristics	345
16.2	The HEAO-1 background map, 3–50 keV	347
16.3	HEAO-1 diffuse galactic emission, 2–60 keV	349
16.4	HEAO-1 fluctuations	350
16.5	Imaging the background, 0.3–3.5 keV; the Einstein deep and medium-sensitivity surveys	353
16.6	The contribution of quasars and active galactic nuclei to the background	356

16.7	HEAO-1 spectrum of the background, 3–50 keV	357
16.8	The galactic soft X-ray background, 0.2–2 keV, the big picture	359
16.9	The galactic soft X-ray background, detailed structure	364
16.10	Conclusions	364
17	Some major observatories of the 1990s	366
17.1	Ginga and Mir-Kvant	366
17.2	Granat – high energy images	368
17.3	ROSAT – a sensitive survey	370
17.4	BBXRT – high throughput · the Astro shuttle payload	372
17.5	ASCA – high throughput	374
17.6	Spectrum-X-Gamma – high throughput	374
17.7	SAX – broad band spectroscopy	375
17.8	XTE – timing	375
17.9	AXAF – high angular resolution and spectroscopy	377
17.10	XMM – high throughput	380
17.11	ALEXIS and DXS – to study the soft background	381
17.12	The ‘Great Observatories’	382
17.13	The last word	382
	<i>List of abbreviations</i>	384
	<i>Selected references and additional reading</i>	388
	<i>Index</i>	394
