# Contents

- 1 Introductory Remarks, Notations, and Units 3**
  - 1.1 The scope of this book 3
  - 1.2 The basic plasma parameters 4
  - 1.3 Statistics, temperature, velocity, and energy distributions 5
  - 1.4 Variations in space and time 11
  - 1.5 Units 14
  
- 2 Modeling of the Atomic Potential in Hot Plasmas 16**
  - 2.1 General properties of the models 16
  - 2.2 The Debye–Hückel theory 18
  - 2.3 The plasma coupling constant 21
  - 2.4 The Thomas–Fermi statistical model 23
  - 2.5 Ion sphere models 39
  - 2.6 Ion correlation models 49
  - 2.7 Statistical theories 50
  
- 3 Atomic Properties in Hot Plasmas 56**
  - 3.1 A few introductory remarks 56
  - 3.2 Atomic level shifts and continuum lowering 58
  - 3.3 Continuum lowering in weakly coupled plasmas 64
  - 3.4 The partition function 70
  - 3.5 Line shift in plasmas 72
  
- 4 Atomic Processes in Hot Plasmas 77**
  - 4.1 Classification of the atomic processes 77
  - 4.2 Definitions and general behavior 82
  - 4.3 The detailed balance principle 84
  - 4.4 Atomic energy levels 85
  - 4.5 Atomic transition probabilities 88
  - 4.6 Electron impact excitation and deexcitation 95
  - 4.7 Electron impact ionization and three-body recombination 101
  - 4.8 Photoionization and radiative recombination 108
  - 4.9 Autoionization and dielectronic recombination 113

<b>5</b>	<b>Population Distributions</b>	<b>122</b>
5.1	General description	122
5.2	Local Thermodynamic Equilibrium	122
5.3	Corona Equilibrium	127
5.4	The Collisional Radiative Steady State	129
5.5	Low density plasmas	133
5.6	The average atom model	137
5.7	Validity conditions for LTE and CE	139
5.8	A remark on the dependence of the sensitivity of the CRSS calculations on the accuracy of the rate coefficients	141
5.9	Time-dependent models	145
<b>6</b>	<b>The Emission Spectrum</b>	<b>147</b>
6.1	The continuous spectrum	148
6.2	The line spectrum—isolated lines	149
6.3	Satellites	154
6.4	Unresolved Transition Arrays (UTAs)	159
6.5	Super transition arrays (STAs)	165
<b>7</b>	<b>Line Broadening</b>	<b>168</b>
7.1	Introduction	168
7.2	What is line broadening?	170
7.3	Natural line broadening	171
7.4	Doppler broadening	172
7.5	Electron impact broadening	174
7.6	Quasi-static Stark broadening	179
7.7	Line broadening: Lyman series	185
<b>8</b>	<b>Experimental Considerations: Plasma Diagnostics</b>	<b>188</b>
8.1	Measurements of the continuous spectrum	188
8.2	Measurements of the line spectrum	192
8.3	Space-resolved plasma diagnostics	200
8.4	Time-resolved spectra	204
8.5	The line width	208
<b>9</b>	<b>The Absorption Spectrum and Radiation Transport</b>	<b>212</b>
9.1	Basic definitions of the radiation field	212
9.2	The radiation field in thermodynamic equilibrium: the black body radiation	215
9.3	Absorption of photons by a material medium	216
9.4	The continuous photoabsorption cross section	218
9.5	The line photoabsorption cross section	221
9.6	The basic radiation transport equation	227
9.7	Radiation transport in plasmas: examples	231
9.8	Diffusion approximation, radiative heat conduction, and Rosseland mean free path	237
<b>10</b>	<b>Applications</b>	<b>240</b>
10.1	X-ray lasers	240
10.2	Applications of high intensity X-ray sources	248
	<b>References</b>	<b>251</b>
	<b>Index</b>	<b>259</b>
