I. POLARIMETRIC OPTICAL FIBERS AND SENSORS *by TOMASZ R. WOLIŃSKI (WARSAW, POLAND)*

§ 1. INTRODUCTION	3
§ 2. POLARIZATION PHENOMENA IN OPTICAL FIBERS	4
2.1. Modes of optical fiber	5
2.2. Polarization of the modes	6
2.3. Optical fibers sensitive to polarization effects	9
2.3.1. Low-birefringence polarization-maintaining fibers	10
2.3.2. Highly birefringent polarization-maintaining fibers	10
2.4. Polarization evolution in the lowest-order modes of a birefringent fiber	12
2.4.1. The Jones formalism	14
2.4.2. The Mueller–Stokes formalism	18
2.4.3. The Poincaré representation	20
§ 3. BIREFRINGENCE IN OPTICAL FIBERS	22
3.1. Intrinsic birefringence	22
3.2. Induced (extrinsic) birefringence	24
3.3. Nonlinear birefringence	24
3.3.1. Optical Kerr effect	25
3.3.2. Pulse shaping	26
3.4. Basic measurements: birefringence and polarization mode dispersion	27
§ 4. DEFORMATION EFFECTS IN HIGHLY BIREFRINGENT FIBERS	28
4.1. Symmetrical deformation effects	28
4.2. Hydrostatic pressure	30
4.3. Axial strain	34
4.3.1. Differential phase evolution and birefringence changes	35
4.3.2. Optical fibers under strain	36
4.3.2.1. Birefringence changes under strain	36
4.3.2.2. Strain sensitivity of HB fibers	37
4.4. Nonsymmetric deformation effect: twist	39
4.4.1. Theory of coupled local modes	40
4.4.1.1. Expansion in terms of local normal modes	40
4.4.1.2. Continuum condition	41
4.4.1.3. Weak mode coupling	41
4.4.1.4. Strong mode coupling	42
4.4.2. Mode coupling in a twisted HB fiber	43
4.4.2.1. Geometrical effect	43

4.4.2.2. Elasto-optic effect	44
4.4.2.3. Coupled-mode equations	45
4.5. Twist under pressure/strain	47
4.5.1. Birefringence measurement under stress	47
§ 5. APPLICATION OF POLARIZATION EFFECTS	52
5.1. Polarimetric fiber-optic sensors and systems	52
5.1.1. Single-mode regime of operation: the truly polarimetric sensor	53
5.1.2. Two-mode regime of operation: the intermodal interference sensor	54
5.1.3. Polarimetric all-fiber sensor	56
5.1.4. Polarimetric strain-gauge manometer	57
5.2. The influence of temperature	58
5.2.1. Methods of temperature compensation	59
5.2.1.1. Temperature compensation in a polarimetric sensor	59
5.2.1.2. Temperature compensation in a two-mode interferometric sensor	63
5.3. Polarimetric fiber-optic sensors with partially polarized laser sources	64
5.4. Polarimetric smart structures	65
5.5. Dynamic polarimetric optical fiber sensing	68
§ 6. CONCLUSIONS AND FUTURE PERSPECTIVES	69
ACKNOWLEDGEMENTS	70
REFERENCES	70

II. DIGITAL OPTICAL COMPUTING

by JUN TANDA AND YOSHIKI ICHIOKA (OSAKA, JAPAN)

§ 1. INTRODUCTION	79
§ 2. BASIC CONCEPTS	79
2.1. Logical operation	80
2.2. Logic gate array	80
2.3. Free-space optical interconnection	81
2.4. Methodology for logic construction	82
2.5. Smart pixels	82
2.6. Optical computing system	83
2.7. Software for problem solving	83
§ 3. LOGIC GATES	83
3.1. Optical logic devices	83
3.2. Coded pattern processing	85
3.3. Optical procedural techniques	87
§ 4. METHODS FOR LOGIC CONSTRUCTION	88
4.1. Holographic interconnection	89
4.2. Multistage interconnection network	90
4.3. Reconfigurable functional module	91
§ 5. DEMONSTRATION SYSTEMS	93
5.1. TSE computer	93
5.2. Free-space flip-flop and DOCIP	94

CONTENTS

ix

5.3. Bell Laboratories systems	95
5.4. O-CLIP	95
5.5. OPALS	96
5.6. SPE-4k	97
5.7. Smart pixel systems	98
5.8. OAL-NC	100
§ 6. SOFTWARE RESEARCH	101
6.1. Parallel logic systems for programming	101
6.1.1. Cellular logic	101
6.1.2. Symbolic substitution	102
6.1.3. Optical array logic	102
6.1.4. Binary image algebra	103
6.1.5. Image logic algebra	104
6.2. Applications of parallel logic systems	105
6.2.1. Image processing	105
6.2.2. Numerical processing	106
6.2.3. Emulation of parallel processes	107
6.2.4. Non-numerical processing	108
§ 7. FURTHER DIRECTIONS	110
§ 8. CONCLUSION	110
REFERENCES	111

III. CONTINUOUS MEASUREMENTS IN QUANTUM OPTICS

by V. PEŘINOVÁ AND A. LUKŠ (OLOMOUC, CZECH REPUBLIC)

§ 1. INTRODUCTION	118
§ 2. THE MANDEL AND SRINIVAS–DAVIES APPROACHES TO MODELING PHOTODETECTION	121
2.1. Semiclassical approach to photodetection	121
2.2. Quantum optical approach to photodetection	125
2.3. Generalized Srinivas–Davies model	128
2.4. Bunching and antibunching	132
§ 3. REVERSIBILITY AND IRREVERSIBILITY OF PHOTOCOUNTING	135
3.1. Scheme of successive measurements	135
3.2. Unraveling the master equation	138
3.3. Logical reversibility in quantum measurement	146
3.4. Reversibility of quantum jumps	148
§ 4. MODELS OF CONTINUOUS MEASUREMENT	148
4.1. Stochastic representation of detection theory	149
4.2. Destructive and nondemolition measurements	158
4.3. Microscopic models and observation of atoms	162
§ 5. PROBABILITY-DENSITY FUNCTIONAL FOR QUANTUM PHOTODETECTION PROCESSES	169
5.1. Generating functionals for random-point process	169
§ 6. QUASICONTINUOUS SCHEMES OF PHOTODETECTION	173
6.1. Measurement with beam splitters	173

6.2. Analogy to continuous measurement	177
6.3. Measurement by means of parametric amplifiers and four-wave mixers	179
§ 7. SPECIAL STATES OF AN OPTICAL MODE BY MEANS OF CONTINUOUS AND NEARLY CONTINUOUS MEASUREMENTS ON THIS MODE	182
§ 8. PRODUCTION OF CORRELATED PHOTONS	185
§ 9. CONDITIONAL GENERATION OF SPECIAL STATES USING IDEAL STATE REDUCTION OF ENTANGLED FIELDS	189
9.1. Correlated photons	190
9.2. Entanglement via other techniques	218
§ 10. SPECIAL STATES OF ONE OR TWO OPTICAL MODES BY MEANS OF CONTINUOUS MEASUREMENT ON A DIFFERENT MODE	226
10.1. Continuous state reduction	226
10.2. Destructive continuous photon-number measurement on the idler mode	230
10.3. Nondemolition continuous photon-number measurement on the idler mode	237
§ 11. EIGENVALUE PROBLEMS FOR INTELLIGENT STATES GENERATED IN IDEAL AND CONTINUOUS MEASUREMENTS	241
11.1. Ideal state reduction	241
11.2. Continuous state reduction	251
§ 12. CONCLUSION	257
ACKNOWLEDGEMENTS	258
APPENDIX A. SUPEROPERATOR-VALUED MEASURE AND RELATED CONCEPTS	258
APPENDIX B. ITÔ'S CALCULUS WITHOUT ITÔ'S DIFFERENTIAL	261
REFERENCES	262

IV. OPTICAL SYSTEMS WITH IMPROVED RESOLVING POWER

by ZEEV ZALEVSKY, DAVID MENDLOVIC (TEL-AVIV, ISRAEL)
AND ADOLF W. LOHMANN (ERLANGEN, GERMANY)

§ 1. INTRODUCTION	273
1.1. Diffraction Resolution (DR)	274
1.2. Geometrical Resolution (GR)	274
1.3. Noise Equivalent Resolution (NER)	275
§ 2. THE SPACE-BANDWIDTH PRODUCT (SW) AS A TOOL FOR SUPER RESOLUTION STUDIES	275
2.1. The Wigner distribution function	276
2.2. The space-bandwidth product of signals: SWI	278
2.2.1. The SWI-number	278
2.2.2. The SWI area	279
2.3. The space-bandwidth product of a system – SWY	279
2.3.1. The SWY number	279
2.3.2. The SWY area	280
2.4. The SW as a 2D function	280
2.4.1. The SW in a hyper space	281
§ 3. SUPER RESOLUTION AS SW ADAPTATION	282
3.1. Lossless transmission through a system	282

3.2. Super-resolution strategy	283
3.3. Hyper space adaptation	284
3.4. Generalizations	286
3.5. Survey of the exploited signal constraints	286
3.5.1. Restricted object shape	286
3.5.2. Temporally restricted signals	289
3.5.3. Wavelength-restricted signals	290
3.5.4. One-dimensional signals	291
3.5.5. Polarization-restricted signals	291
§ 4. SUPER RESOLUTION BASED ON TEMPORAL CONSTRAINTS	293
4.1. 1D time multiplexing super resolution	294
4.1.1. System analysis: incoherent	294
4.1.2. System analysis: coherent	299
4.1.3. Experimental verification	301
4.2. 2D time multiplexing super resolution in x and in y	304
4.2.1. System analysis	304
4.2.2. Experimental verification	306
4.3. High-frequency enhancement by means of a super-resolution optical system for temporally restricted objects	308
4.4. Related topics	311
§ 5. THE GENERALIZED WIGNER FUNCTION FOR THE ANALYSIS OF SUPER-RESOLUTION SYSTEMS	312
5.1. Motivation	312
5.2. Quasi-monochromatic and polychromatic Wigner function	312
5.3. Wigner function of a signal superimposed by a grating	314
5.4. Fourier transforming and passing through a slit	316
§ 6. SUPER RESOLUTION FOR OBJECTS WITH FINITE SIZE	320
6.1. The setup and the layout of the theory	320
6.2. Theory of the coherent case	322
6.3. Ghost images	327
6.4. Theory of the incoherent case	328
§ 7. WAVELENGTH-MULTIPLEXING SUPER RESOLUTION	329
7.1. The suggested system	330
7.2. Theoretical analysis of the system	334
7.3. Experimental results	336
§ 8. CONCLUSIONS	338
LIST OF ABBREVIATIONS AND SYMBOLS	339
ACKNOWLEDGEMENTS	339
REFERENCES	340

V. DIFFRACTIVE OPTICS: ELECTROMAGNETIC APPROACH

by JARI TURUNEN, MARKKU KUITTINEN (JOENSUU, FINLAND) AND FRANK WYROWSKI (JENA, GERMANY)

§ 1. INTRODUCTION	345
§ 2. SOME RESONANCE-DOMAIN EFFECTS	346
2.1. Total absorption of light by a grating	346

2.2. Phase retardation by a reflection grating	347
2.3. Bragg effect in a binary grating	347
2.4. Guided-mode resonance effect	348
2.5. Binary beam deflector for normal incidence	348
§ 3. ELECTROMAGNETIC THEORY OF GRATINGS	349
3.1. Grating-diffraction geometry	349
3.2. Rayleigh expansions and grating equations	350
3.3. Diffraction efficiencies	352
3.4. Exact eigenmode model for binary gratings	352
3.5. Other methods of grating analysis	355
3.6. Models for non-periodic geometries	356
3.7. Thin-element approximation	357
3.8. Effective media	357
§ 4. LINEAR GRATINGS OPERATING IN FIRST-ORDER MODE	359
4.1. Binary gratings	359
4.2. Multilevel gratings	362
§ 5. LINEAR GRATINGS OPERATING IN ZEROTH-ORDER MODE	364
5.1. Metallic subwavelength transmission gratings	365
5.2. Grating antireflection surfaces	367
5.3. Grating retarders	368
5.4. Guided-mode resonance filters	370
§ 6. MODULATED GRATINGS OPERATING IN FIRST-ORDER MODE	371
6.1. High-carrier-frequency diffractive elements	371
6.2. High-numerical-aperture diffractive lenses	372
§ 7. MODULATED GRATINGS OPERATING IN ZEROTH-ORDER MODE	374
7.1. Spatially variable effective media	374
7.2. Subwavelength-structured diffractive lenses	375
7.3. Polarization multiplexing with effective media	376
7.4. Spatially variable polarization components	376
§ 8. GRATINGS OPERATING IN MULTI-ORDER MODE	377
8.1. Two-beam splitters	378
8.2. Array illuminators	379
§ 9. CONCLUSIONS	383
REFERENCES	384

VI. SPECTROSCOPY IN POLYCHROMATIC FIELDS

by ZBIGNIEW FICEK (BRISBANE, AUSTRALIA) AND HELEN S. FREEDHOFF (TORONTO, CANADA)

§ 1. INTRODUCTION	391
§ 2. SUBHARMONIC RESONANCES	394
2.1. Experimental studies	396
2.2. Applications of subharmonic spectroscopy	397
2.2.1. Two-photon laser	397
2.2.2. Lasing without population inversion	397

CONTENTS

xiii

2.2.3. Laser cooling	398
§ 3. THEORETICAL METHODS	398
3.1. Floquet method	399
3.1.1. Master equation	399
3.1.2. Optical Bloch equations	400
3.1.3. Recurrence relation	401
3.2. Dressed-atom method	404
3.2.1. Dressed states	404
3.2.2. Fluorescence	405
3.2.3. Populations	406
3.2.4. Coherences	406
3.2.5. Fluorescence spectrum	407
3.2.6. Near-resonance absorption spectrum	408
3.2.7. Autler–Townes absorption spectrum	409
§ 4. BICHROMATIC FIELDS	409
4.1. Symmetric excitation	410
4.1.1. Dressed states	410
4.1.2. Fluorescence spectrum	413
4.1.3. Near-resonance absorption spectrum	415
4.1.4. Autler–Townes absorption spectrum	417
4.2. Nearly symmetric excitation	417
4.2.1. Fluorescence spectrum	417
4.2.2. Near-resonance absorption spectrum	420
4.2.3. Autler–Townes absorption spectrum	420
4.3. Doubly driven atom	421
4.3.1. The multiphoton ac Stark effect	422
4.3.1.1. Fluorescence spectrum	423
4.3.1.2. Near-resonance index of refraction	424
4.3.1.3. Autler–Townes absorption spectrum	425
4.3.1.4. Shifts of the subharmonic resonances	425
4.3.2. Two fields with equal frequencies	427
4.3.3. Driving at the Rabi frequency	430
§ 5. POLYCHROMATIC FIELDS, $p \geq 3$	431
5.1. Amplitude-modulated driving fields	431
5.1.1. Floquet treatment	431
5.1.2. Dressed-atom treatment	432
5.2. Driving at successive Rabi frequencies	436
5.3. Multiple fields, $p > 3$	437
