Preface	vii
1 Introduction	1
1.1 Vorticity Dynamics	1
1.1.1 Basics	1
1.1.2 Invariants of the Euler Equations	5
1.1.3 Two Dimensions	8
1.1.4 Point Vortex Decomposition	12
1.1.5 Bibliographic Notes	18
1.2 Hamiltonian Dynamics	20
1.2.1 Canonical Formulation	20
1.2.2 Noncanonical Formulation	27
1.2.3 Geometric Fluid Mechanics	32
1.2.4 Integrable Systems and Action-Angle Coordinates	34
1.2.5 Near-Integrable Systems: KAM Theory and the Poincaré–Melnikov Method	42
1.2.6 Adiabatic Invariants and Geometric Phases	50
1.3 Summary of Basic Questions	61
1.4 Exercises	62
2 N Vortices in the Plane	65
2.1 General Formulation	66
2.2 $N = 3$	73

2.2.1	Equilibria	77
2.2.2	Trilinear Formulation	81
2.2.3	Collapse	84
2.3	$N = 4$	88
2.3.1	Reduction	92
2.3.2	Application of KAM Theory	95
2.3.3	Nonintegrable Cases	97
2.4	Bibliographic Notes	112
2.5	Exercises	114
3	Domains with Boundaries	117
3.1	Green's Function of the First Kind	118
3.2	Method of Images	122
3.3	Conformal Mapping Techniques	128
3.4	Breaking Integrability	133
3.5	Bibliographic Notes	135
3.6	Exercises	136
4	Vortex Motion on a Sphere	139
4.1	General Formulation	140
4.2	Dynamics of Three Vortices	146
4.2.1	Geometric Classification Scheme	148
4.2.2	Equilibria	149
4.3	Phase Plane Dynamics	160
4.4	3-Vortex Collapse	163
4.4.1	Geometry of Partner States	170
4.5	Stereographic Projection	172
4.6	Integrable Streamline Topologies	175
4.6.1	Two Vortices	177
4.6.2	Three Vortices	180
4.6.3	Rotating Frames	190
4.7	Boundaries	193
4.7.1	Images	195
4.8	Bibliographic Notes	204
4.9	Exercises	206
5	Geometric Phases	209
5.1	Geometric Phases in Various Contexts	210
5.2	Phase Calculations For Slowly Varying Systems	216
5.3	Definition of the Adiabatic Hannay Angle	223
5.4	3-Vortex Problem	228
5.4.1	Geometric Interpretation	232
5.4.2	Other Configurations	234
5.5	Applications	240
5.5.1	Spiral Structures	240

5.5.2	Pattern Evocation	243
5.6	Exercises	244
6	Statistical Point Vortex Theories	247
6.1	Basics of Statistical Physics	249
6.1.1	Probability Distribution Functions	249
6.1.2	Elements of Ergodic Theory	255
6.1.3	Negative Temperature States	258
6.2	Statistical Equilibrium Theories	260
6.2.1	Pointin–Lundgren Theory in the Unbounded Plane	260
6.2.2	Pointin–Lundgren Theory in Bounded Regions	268
6.3	Maximum Entropy Theories	273
6.3.1	Joyce–Montgomery Approach	273
6.4	Nonequilibrium Theories	277
6.5	Exercises	283
7	Vortex Patch Models	285
7.1	Introduction to Vortex Patches	286
7.2	The Kida-Neu Vortex	287
7.3	Time-Dependent Strain	290
7.4	Melander–Zabusky–Styczek Model	294
7.5	Geometric Phase for Corotating Patches	302
7.6	Viscous Shear Layer Model	307
7.7	Bibliographic Notes	313
7.8	Exercises	315
8	Vortex Filament Models	317
8.1	Introduction to Vortex Filaments and the LIE	318
8.2	DaRios–Betchov Intrinsic Equations	332
8.3	Hasimoto's Transformation	336
8.4	LIA Invariants	342
8.5	Vortex-Stretching Models	345
8.6	Nearly Parallel Filaments	348
8.7	The Vorton Model	353
8.8	Exercises	354
	References	357
	Index	411
