

Contents

I	The Three Pillars of Computational Physics	1
1	Finite Differences	7
1.1	Interpolation Formulae	9
1.1.1	NGF Interpolation	9
1.1.2	NGB Interpolation	10
1.1.3	ST Interpolation	11
1.2	Difference Quotients	12
1.2.1	DNGF Formulae	12
1.2.2	DNGB Formulae	14
1.2.3	DST Formulae	15
1.3	Finite Differences in Two Dimensions	17
1.4	Sample Applications	18
1.4.1	Classical Point Mechanics	18
1.4.2	Diffusion and Thermal Conduction	19
2	Linear Algebra	21
2.1	Exact Methods	22
2.1.1	Gauss Elimination and Back Substitution	22
2.1.2	Simplifying Matrices: The Householder Transformation	25
2.1.3	LU Decomposition	26
2.1.4	Tridiagonal Matrices: Recursion Method	29
2.2	Iterative Methods	31
2.2.1	Jacobi Relaxation	32
2.2.2	Gauss-Seidel Relaxation (GSR)	34
2.2.3	Successive Over-Relaxation (SOR)	34
2.2.4	Alternating Direction Implicit Method (ADI)	36
2.2.5	Conjugate Gradient Method (CG)	36
2.3	Eigenvalues and Eigenvectors	40
2.3.1	Largest Eigenvalue and Related Eigenvector	40
2.3.2	Arbitrary Eigenvalue/-vector: Inverse Iteration	42
2.4	Sample Applications	43
2.4.1	Diffusion and Thermal Conduction	43
2.4.2	Potential Equation	44
2.4.3	Electronic Orbitals	45

3 Stochastics	47
3.1 Equidistributed Random Variates	49
3.1.1 Linear Congruential Generators	49
3.1.2 Shift Register Generators	50
3.2 Other Distributions	53
3.2.1 Fundamentals	53
3.2.2 Transformation Method	56
3.2.3 Generalized Transformation Method	57
3.2.4 Rejection Method	59
3.2.5 Multivariate Gaussian Distribution	62
3.2.6 Equidistribution in Orientation Space	66
3.3 Random Sequences	68
3.3.1 Fundamentals	68
3.3.2 Markov Processes	71
3.3.3 Autoregressive Processes	74
3.3.4 Wiener-Lévy Process	77
3.3.5 Markov Chains and the Monte Carlo method	78
3.4 Stochastic Optimization	80
3.4.1 Simulated Annealing	81
3.4.2 Genetic Algorithms	82
II Everything Flows	85
4 Ordinary Differential Equations	89
4.1 Initial Value Problems of First Order	90
4.1.1 Euler-Cauchy Algorithm	90
4.1.2 Stability and Accuracy of Difference Schemes	91
4.1.3 Explicit Methods	94
4.1.4 Implicit Methods	96
4.1.5 Predictor-Corrector Method	98
4.1.6 Runge-Kutta Method	101
4.1.7 Extrapolation Method	104
4.2 Initial Value Problems of Second Order	105
4.2.1 Verlet Method	105
4.2.2 Predictor-Corrector Method	108
4.2.3 Nordsieck Formulation of the PC Method	110
4.2.4 Runge-Kutta Method	112
4.2.5 Symplectic Algorithms	112
4.2.6 Numerov's Method	117
4.3 Boundary Value Problems	119
4.3.1 Shooting Method	120
4.3.2 Relaxation Method	121

5 Partial Differential Equations	125
5.1 Initial Value Problems I (Hyperbolic)	129
5.1.1 FTCS Scheme; Stability Analysis	129
5.1.2 Lax Scheme	131
5.1.3 Leapfrog Scheme (LF)	133
5.1.4 Lax-Wendroff Scheme (LW)	135
5.1.5 Lax and Lax-Wendroff in Two Dimensions	135
5.2 Initial Value Problems II (Parabolic)	138
5.2.1 FTCS Scheme	138
5.2.2 Implicit Scheme of First Order	140
5.2.3 Crank-Nicholson Scheme (CN)	141
5.2.4 Dufort-Frankel Scheme (DF)	143
5.3 Boundary Value Problems: Elliptic DE	143
5.3.1 Relaxation and Multigrid Techniques	147
5.3.2 ADI Method for the Potential Equation	148
5.3.3 Fourier Transform Method (FT)	150
5.3.4 Cyclic Reduction (CR)	153
III Anchors Aweigh	157
6 Simulation and Statistical Mechanics	161
6.1 Model Systems of Statistical Mechanics	164
6.1.1 A Nutshellfull of Fluids and Solids	164
6.1.2 Tricks of the Trade	168
6.2 Monte Carlo Method	171
6.3 Molecular Dynamics Simulation	175
6.3.1 Hard Spheres	175
6.3.2 Continuous Potentials	177
6.3.3 Beyond Basic Molecular Dynamics	178
6.4 Evaluation of Simulation Experiments	181
6.4.1 Pair Correlation Function	182
6.4.2 Autocorrelation Functions	184
6.5 Particles and Fields	185
6.5.1 Ewald summation	186
6.5.2 Particle-Mesh Methods (PM and P3M):	188
6.6 Stochastic Dynamics	191
7 Quantum Mechanical Simulation	195
7.1 Diffusion Monte Carlo (DMC)	196
7.2 Path Integral Monte Carlo (PIMC)	201
7.3 Wave Packet Dynamics (WPD)	209
7.4 Density Functional Molecular Dynamics (DFMD)	211

8 Hydrodynamics	215
8.1 Compressible Flow without Viscosity	216
8.1.1 Explicit Eulerian Methods	217
8.1.2 Particle-in-Cell Method (PIC)	218
8.1.3 Smoothed Particle Hydrodynamics (SPH)	220
8.2 Incompressible Flow with Viscosity	226
8.2.1 Vorticity Method	227
8.2.2 Pressure Method	229
8.2.3 Free Surfaces: Marker-and-Cell Method (MAC)	231
8.3 Lattice Gas Models for Hydrodynamics	232
8.3.1 Lattice Gas Cellular Automata	232
8.3.2 The Lattice Boltzmann Method	236
8.4 Direct Simulation Monte Carlo / Bird method	237
Appendixes	239
A Machine Errors	241
B Discrete Fourier Transformation	245
B.1 Fundamentals	245
B.2 Fast Fourier Transform (FFT)	246
Bibliography	249
Index	257
