

CONTENTS

I. INTRODUCTION	
1. Conduction of electricity in electrolytes	1
2. Conduction of electricity in gases	2
3. Thomson's determination of the specific charge	5
4. Determination of the elementary charge	8
5. The Zeeman effect	9
II. ATOMISTIC FOUNDATION OF MAXWELL'S THEORY	
1. Formulation of the problem	13
2. Averaging over physically infinitesimal regions	15
3. Identification of the electromagnetic field averages	16
4. The average charge density	17
5. The average current density	22
6. Conclusion	27
III. DYNAMICAL PROPERTIES OF SYSTEMS OF CHARGED PARTICLES	
1. Systems of charged particles	28
2. The Lagrangian and Hamiltonian	29
3. System in slowly varying external field	31
4. Larmor's theorem	34
5. Magnetic moment and angular momentum	37
6. The gyromagnetic effects	38
7. Maxwell's considerations concerning the inertia of electric currents	41
IV. MAGNETIC PROPERTIES OF MATTER	
1. Intrinsic and induced magnetic moment; diamagnetism	44
2. The paradox of the classical theory of magnetism	46
3. Paramagnetism	47
4. Ferromagnetism	52
5. The internal field	56

V. ELECTRIC POLARIZATION AND OPTICAL DISPERSION	
1. Electric polarization in constant fields	59
2. Elementary theory of dispersion	64
3. Anomalous dispersion and absorption	68
4. Radiation damping and extinction coefficient	71
5. Scattering of light	75
6. Critical opalescence	80
VI. RIGOROUS THEORY OF DISPERSION	
1. The average polarization	94
2. The average polarizability	101
3. The transversality condition	104
4. The extinction theorem	105
5. The extinction coefficient	108
APPENDIX	111
INDEX	116

Note. Formulae are numbered separately in each chapter. Formula (33) of Chapter V, say, is referred to as (33) in Chapter V, and as (V, 33) in any other chapter.
