CHAP.		Page
I.	MATHEMATICAL INTRODUCTION.	
	1. Introduction - - - - -	1
	2. Vectors and Operators - - - - -	3
	(a) Vectors - - - - -	3
	(b) Operators - - - - -	6
	3. The Eigenvalue-eigenvector Equation - - - - -	8
	4. Eigenvectors as Basic Vectors - - - - -	9
	5. Projection Operators - - - - -	9
	6. Commuting Operators and Simultaneous Eigenvectors - - - - -	10
	7. General Comments - - - - -	13
	8. Functions of Hermitian Operators - - - - -	15
II.	PHYSICAL PRINCIPLES.	
	9. The Concept of State - - - - -	18
	10. Observations and Observables - - - - -	22
	11. General Transformation Theory - - - - -	23
	(a) Discrete Eigenvalue Spectra - - - - -	23
	(b) Continuous Eigenvalue Spectra - - - - -	24
	(c) Continuous and Mixed Eigenvalue Spectra - - - - -	28
	12. Point Transformations - - - - -	30
III.	PHYSICAL PRINCIPLES—OBSERVABLES.	
	13. Introduction - - - - -	32
	14. Classical Contact Transformations - - - - -	33
	15. Infinitesimal Contact Transformations - - - - -	33
	16. Examples of Infinitesimal Contact Transformations - - - - -	34
	17. Form Invariance of the Hamiltonian—Constants of the Motion - - - - -	35
	18. Quantal Contact Transformations—Quantum Conditions - - - - -	35
	19. General Commutators - - - - -	41
	20. Elements of Non-commutative Algebra - - - - -	43
	(a) Introduction - - - - -	43
	(b) Vertical Communication—Shift Operators - - - - -	43
	(c) Angular Momentum—Magnitude - - - - -	46
	21. The Addition Theorem - - - - -	47
	22. Normalization of Shift Operators - - - - -	53
	23. Transformation Amplitudes - - - - -	55
IV.	PHYSICAL REPRESENTATION THEORY.	
	24. Introduction—The Canonical Representations - - - - -	59
	25. Fixed and Moving Operators and Representations - - - - -	64
	26. Change of State in Time - - - - -	66
	27. The Density Matrix - - - - -	71
V.	FUNDAMENTALS OF PERTURBATION THEORY.	
	28. Introduction - - - - -	75
	29. Discrete Spectrum—Non-degenerate - - - - -	76
	30. Mixed Spectrum—Non-degenerate - - - - -	78
	31. Perturbed Representatives of General Operators - - - - -	80
	32. Degenerate Case - - - - -	81
	33. Reduction of Degenerate Case to Non-degenerate - - - - -	85
	34. Relative Degeneracy - - - - -	86

CHAP.		Page
VI.	GROUP CONCEPTS AND SYMMETRY PROPERTIES.	
	35. n -Particle Systems	89
	36. Supplementary Conditions	90
	37. Identical Systems	91
	38. Introductory Remarks on Group Theory	93
	39. The Group Postulates	94
	40. Isomorphism	94
	41. Subgroups	95
	42. Cosets	95
	43. Classes of Conjugate Elements	95
	44. The Symmetric Group Π_n	96
	(a) Definition	96
	(b) Cycle Structure	97
	(c) The Classes of Π_n	97
	45. Group Representations	100
	46. The Kronecker Product	104
	47. The Orthogonality Relation for Groups of Finite Order	105
	48. Group Characters as Class Functions	107
	49. Class Multiplication	108
	50. Permutations as Quantal Operators	112
	51. Symmetrical and Antisymmetrical States	113
	52. Electron Spin	115
	53. Spin Rotations	116
VII.	THE ANTISYMMETRY PRINCIPLE.	
	54. The Antisymmetry Principle	119
	55. The Exclusion Principle	119
	56. The Nature of the Approximate Orbitals	121
	57. The Density Matrix in Many-Electron Systems	123
	58. Application to Free Electrons	129
	59. The Spinless Density Operator	130
VIII.	THE VARIATION PRINCIPLE.	
	60. Stationary States	132
	61. Non-stationary States	133
	62. Applications of the Variational Method—Hartree Equations	135
	63. Physical Aspects of the Hartree Method—Matrix Elements	140
	64. The Extended Hartree Equations	142
	65. Antisymmetric Functions	143
	66. Fock-Dirac Equations	145
	67. General Comments	147
	68. Equations of Motion—Density Matrix	148
	69. Critique of the Fock-Dirac Equations	150
IX.	THE STATISTICAL METHOD.	
	70. Introduction	157
	71. Elements of Physical Statistics	157
	72. Equations of Motion	160
	73. Variational Aspect	168
	74. General Remarks	169
	75. Boundary Conditions—Interpretation	170
	(a) Thomas-Fermi (Hartree) Approximation	170
	(b) Fock-Dirac Approximation	173

CHAP.		Page
X.	THE DIRAC VECTOR MODEL.	
	76. The Dirac Character Operators	177
	77. The Dirac Exchange-Spin Identity	180
	78. Dirac Character Eigenvalues—Antisymmetric States	182
	79. Application to n -Particle Systems	183
	80. Specification of Unperturbed States—Free and Filled Orbits	187
	81. Modification of the Vector Model for Filled Orbits	187
	82. The Branching Rule	189
	83. Spatial Degeneracy—Calculation of Spectral Term Values	190
	84. Supplementary Notes on the Simple Vector Model	199
	85. Matrix Viewpoint—Formal Group Characters	202
	86. Matrix Representations of the Permutations	204
	87. Symbolic Determination of the Irreducible Representations of the Symmetric Group	207
	88. Generalization of the Dirac Vector Model	220
	(a) Configuration Interaction and Filled Orbits	220
	(b) Method of Iterations or Invariants—Matrical	224
	(c) Method of Iterations of Invariants—Symbolical	227
	89. Molecular Problems	227
	(a) Non-directional Valence	227
	(b) Pair Bonds	229
	(c) Non-orthogonality Corrections—The Four-Electron Problem	229
	90. Note on Directional Valence	231
	91. Factorization of the Secular Equation	232
	(a) The Six-Electron Problem	232
	(b) The Eight-Electron Problem	240
XI.	SECOND QUANTIZATION.	
	92. Introduction	246
	93. Symmetry Properties	249
	(a) Symmetric Systems	249
	(b) Antisymmetric Systems	255
	94. Note on Higher-Order Interaction Operators	262
	95. Equations of Motion	264
	96. Equivalence Theorem and Complex Representations	264
	97. Quantized Wave-Functions	271
	98. The Self-consistent Field—Wave Field Method	276
	99. The Dirac Vector Model—Wave Field Method	278
	100. The Hole Formalism	281
XII.	THE S -MATRIX THEORY.	
	101. Ultimate Observables	292
	102. Scattering Formalism—Definition and Properties of S	295
	APPENDIX I	301
	APPENDIX II	302
	NAME INDEX	306
	SUBJECT INDEX	307
